Medical Notes in Parliament

Parliament rose for Christmas on December 18th On that day the Royal Assent was given to the Expiring Laws Continuance Act, the Trunk Roads Act and the Public Order Act The House of Lords stands adjourned till January 26th and the House of Commons till January 19th

The Geneva Convention Bill was read a first time by the House of Commons on December 16th Various orders consequential on the Government of India and Burmah Acts, 1935, have been approved by both Houses and a message from the King was received by Parliament on December 16th which announced that effect would be given to these decisions

The Earsdon Joint Hospital District Bill was read a second time by the House of Commons on December 16th It has been decided that the Liverpool United Hospital Bill shall *originate in the House of Lords*

Preparation of the Factory and Workshop Bill has reached an advanced stage and the Home Secretary hopes to introduce it shortly after the Christmas recess This will be a codifying and amending Bill

Unemployment and Malnutrition

Mr GEORGE HALL moved on December 17th that the Unemployment Assistance (Determination of Need) Regulations so far as they involved reductions in existing allowances should be suspended He said the operation of the regulations affected 520 000 householders or with their dependants 1,500 000 people He quoted a person charged with the care of the health of a large urban district in South Wales who said that 76 per cent of the pregnant and nursing mothers attended the clinics in that district and the majority of these mothers suffered from malnutrition Debilitated children were seen at the clinics and many women could not breast feed their children owing to malnutrition Of 270 children in the schools who received one meal a day 215 were still in a state of malnutrition and of 812 receiving milk only 310 were normal

Mr BOOTHBY said medical and scientific opinion which was beyond reproach declared that 20 per cent of the population was undernourished Recruiting figures bore this out

Mr ERNEST BROWN said the Government had paid out this year from the employment exchanges nearly £80 000 000 of which nearly £40 000 000 was paid on the assistance side In the past twelve months £80 000 000 had been paid in South Wales for benefit and assistance Under the new regulations more than a third of the cases would get increases The process of reviewing the cases was nearing completion and no applicant had yet received a notice that his allowance would be decreased as the result of the new regulations Mr Hall's motion was *rejected* by 218 *to* 135

Distress in the Highlands and Islands

Mr ROBERT GIBSON opened a debate on December 16th on distress and depopulation in the Highlands

Mr MALCOLM MACMILLAN read a petition from inhabitants of a roadless district in Harris who *declared that* in cases of illness it is at least a matter of hours before the doctor *can be brought* and if the patient has to be removed to hospital it means heavy labour for the bearers and unspeakable torture for the sufferer before the road end can be reached He instanced a confinement *during which* one twin was born in Harris and the other several hours later in the town of Stornoway whither the mother had to be carried over bad roads after enduring a boat journey In the island of Scalpay there was only *one nurse* and no doctor Outside Stornoway Tarbert and the few smaller towns of the Hebrides there was no communal water supply and in North Uist the water was taken *from dip holes* or small lochs fouled by cattle

Mr CASSELLS spoke on old and bad housing in the Highlands

Mr ELLIOT said that in the Highlands since 1919 over 6 000 houses had been built with State aid Some 3 000 had been improved under the Rural Workers Acts and the Department of Agriculture had made loans to 4 000 more persons for improvement of their houses The adjusted death rate in the Highlands was about four fifths of the death rate for Scotland as a whole The sickness rate among the insured population was only 70 per cent of that for the country as a whole Infant mortality in the Highlands and Islands was far below that for the country as a whole—32 per cent below These were not the signs of a dying and decaying race They were *the signs of* a race which had undergone and was undergoing hardships and required that its lot should be improved The Highland population was susceptible to tuberculosis but not so much in the Highlands as when the Highlander moved into the crowded cities The Government intended to examine the problem further The Scottish Development Council in consultation with the late Secretary of State had set up a Highlands Subcommittee That subcommittee was now engaged on its investigations He hoped that it would bring forward far reaching proposals They would receive the careful and sympathetic consideration of the Government

Housing in Glasgow

Replying on December 18th to a discussion about housing in Glasgow Mr ELLIOT said he did not think 2 000 houses would be built in Glasgow this year nor 3 000 next year For some time past representations about unfit houses had been restricted till the mass of condemned houses had been dealt with It was hoped within six months to resume the practice of making representations in regard to unfit houses There was enough land in possession of Glasgow Corporation for two years building at the rate of 6 500 houses a year Scotland had nearly completed 200 000 houses but had not yet made a serious inroad on the problem In Glasgow 4 638 single apartment houses were each occupied by four or more persons and 9 786 two apartment houses were occupied by six or more persons not taking account of children under 1 year For Scotland as a whole 23 per cent of the houses were overcrowded against 3 8 per cent for England and Wales In the last three years roughly 20 000 houses a year had been built in Scotland but in the past year not much over 15 000 and only some 20 000 houses were under construction That was not a record of which any Secretary of Scotland could be proud There were 30 000 families in Glasgow living in conditions which provided only one water closet for four families The Government proposals in the new block grants would ease the financial position of local authorities They had 40 000 families averaging more than three families to a water closet and 10 000 houses condemned as unfit in Glasgow There were 600 houses scheduled for demolition that had not been demolished May and June would pass before the medical officer could begin to deal with other houses for demolition That was not common sense it was not business it was not investment

Gas proofing Rooms— Mr GEOFFREY LLOYD announced on December 17th that the gas proofing of rooms in private houses would be further dealt with in the handbook in course

of preparation for householders As it was practicable to render rooms gas-proof, and as everyone in areas exposed to attack would be supplied with a respirator, it was not proposed to recommend that shelter-rooms in private houses should be fitted with air-filtration units

Acetic Acid and Vinegar—Sir KINGSLEY WOOD said on December 18th that he was inquiring into the death of a woman who had been sold acetic acid for a mineral water drink Mr KELLY, who put the question, suggested that steps should be taken to prevent the sale of acetic acid in its raw or diluted form as vinegar

Phthisis in Southern Rhodesia—Mr MALCOLM MACDONALD, answering Mr Creech Jones on December 18th, said he was not aware of any grounds for an investigation into the prevalence of phthisis in the Southern Rhodesian mines There was a certain amount of phthisis among the miners, and the medical service took many steps to deal with it Mr CREECH JONES asserted that there was no institution for diagnosing these cases, and also that there was a high death rate in the native population Mr MACDONALD said he was unaware of the high death rate He would consider any information Mr Creech Jones could lay before him

Comfort and Warmth—Mr S F MARKHAM asked whether, as the Departmental Committee investigating the warmth factor in comfort at work only carried out its investigations during the winter months, facilities would be given for an extension of these investigations to cover the spring and autumn months with particular reference to the effects not only of warmth in comfort, but also of humidity Mr RAMSAY MACDONALD, in a written reply, said that this investigation was made on behalf of the Medical Research Council, under the direction of a committee jointly appointed by that body and by the Department of Scientific and Industrial Research The committee had already recommended that the work should be extended along lines such as Mr Markham suggested, and action would be taken accordingly

Ambulance Work in Spain—Mr EDEN, answering Miss Eleanor Rathbone on December 16th, said the British Red Cross had sent no medical or nursing personnel to either side in Spain, and had not recognized the status of medical units sent out by voluntary efforts An approach to the opposing forces was under consideration, with a view to persuading them to apply the provisions of the Convention in relation to the protection of Red Cross units The British Red Cross had not asked the advice of the British Government in the matter The Geneva Red Cross Convention, 1929, did not apply to the civil war in Spain The British Government had not dissuaded anyone from taking humanitarian action

Administration of Broadmoor—Asked by Mr McEntee about the administration of Broadmoor Criminal Lunatic Asylum on December 17th, Sir JOHN SIMON replied that members of the Council of Supervision appointed under Section 4 of the Criminal Lunatic Asylums Act, 1860, undertook this public service without remuneration As regards the staff, there had been no recent increase in the salary of the medical superintendent apart from the consolidation of pay and bonus which applied to all Government servants During the present year there had been increases in the remuneration of the other medical officers and of the subordinate staff

Medical Treatment at Training Centres—Asked by Miss Irene Ward on December 17th to establish a medical centre in connexion with the Government training centres, Mr ERNEST BROWN replied that facilities at the local training centres which were being set up in the special areas in England and Wales would include provision of medical dental, and optical treatment for men who could not at present be admitted to the Ministry's centres owing to minor physical disabilities

Toll of the Roads—Between January 1931 and December 1936, approximately 40 350 persons have been killed and 1 290 000 injured in road accidents recorded by the Ministry of Transport

Medical News

ERGOAPIOL (SMITH)

AMENORRHEA - DYSMENORRHEA
MENORRHAGIA - MENOPAUSE

Today, as for years, Ergoapiol (Smith) is the accepted medicament in combating those menstrual anomalies which may be traced to constitutional disturbances, atonicity of the reproductive organs, inflammatory-conditions of the uterus or its appendages, mental emotion or exposure to the elements

The physician readily can ascertain whether his prescription for Ergoapiol (Smith) has been correctly filled by dividing the capsule at the seam, thus revealing the initials M H S embossed on the *inner* surface, as shown in photographic enlargement

ANAHÆMIN B.D.H.

In the treatment of pernicious anæmia

The introduction of Anahæmin—the active hæmatopoietic principle of liver—has wrought a revolution in the treatment of pernicious anæmia, average cases respond to an initial injection of 2 c c, followed by 1 c c injections at 10 day intervals until the blood count has remained normal for a month For the maintenance of the patient in a condition of robust health a monthly injection of 2 c c is usually sufficient in most cases

After Influenza Pneumonia and other Acute Infections

The general action of 'Bynin'Amara is manifested by increased tone of the nervous, muscular and cardio-vascular systems It stimulates the digestive organs, improves the flagging appetite, corrects anæmia and aids nutrition generally

The marked asthenia and nervous depression which are prominent features of the post-influenzal state, yield rapidly to its influence A course whenever there is any indication of lowered resistance is a valuable safeguard against infection

In bottles at 2/-, 3/6, 6/6 and 12/-

MEDICAL DIAGNOSIS

Some Clinical Aspects

By S LEVY SIMPSON, M A , M D (Camb), M R C P (Lond), Physician, Willesden General Hospital, Assistant Physician, Princess Louise Kensington Hospital for Children

" concisely written and well expressed Within a comparatively small space much sound information is conveyed —PRACTITIONER

'The author has compounded his book very neatly and shrewdly The busy practitioner will find it both light and profitable —LANCET

Just Published With 246 Illustrations and 9 Coloured Plates Pp xii + 540 Demy 8vo 40s net (postage abroad 1s)

DIAGNOSIS AND NON-OPERATIVE TREATMENT OF THE DISEASES OF THE COLON AND RECTUM

By GOTTWALD SCHWARZ, M D , Professor, University of Vienna, Head, X-Ray Dept , Kaiserin Elizabeth Hospital, Vienna, Honorary Member, American Roentgen Ray Society, etc , JACQUES GOLDBERGER, M D , Consulting Physician, Carlsbad, and CHARLES CROCKER, M D , New York

EXTRACT FROM FOREWORD —

While the surgical treatment of the colon and rectum is a special field of surgery and hence reserved for the surgeon the authors believe nevertheless that there is much to be said about non surgical treatment when such treatment is possible Hence they have attempted to discuss all varieties of non operative treatments which may be of value in these diseases

FIRST IMPRESSION OF VOLUME I EXHAUSTED REPRINT NOW READY

TREATMENT IN GENERAL PRACTICE

THE MANAGEMENT OF SOME MAJOR MEDICAL DISORDERS

Articles republished from the "British Medical Journal"

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza, the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci, in addition to other organisms incriminated in the causation of coryza and influenzal infections It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the brochure will gladly be supplied to any physician on request

MARMITE

as an aid to

Correct Nutrition

Adequate nutrition must play an important part in the Fitter Britain Campaign The nation must be properly fed before any system of physical training can be effective

Injudicious choice of food appears to be only too common, and no section of the community is immune to the disastrous consequences of malnutrition

Physicians prescribe Marmite as a routine measure because they appreciate its intrinsic worth as a dietary adjunct, and on account of the abundant evidence which exists of its prophylactic and therapeutic value

MARMITE

(YEAST EXTRACT)

for its content of vitamin B_1 and the B_2 complex

and for its anti-anaemic properties

An extension of the pathological department of the Children's Hospital (King Edward VII Memorial) Birmingham has been erected to the memory of Dr Robert John Gittins, who rendered devoted service to the hospital as pathologist for four years and gave his life in an unavailing attempt to save his son from drowning on October 7th 1934 The extension will be opened on Wednesday January 6th, at 3 30 p m, by the Lord Mayor of Birmingham

In 1926 a memorandum on fire precautions at voluntary hospitals was prepared by the Management Committee of King Edward's Hospital Fund for London These notes have now been thoroughly revised with the help of Major C C B Morris chief of the London Fire Brigade Their reissue gives an opportunity for hospital committees who have not recently made a close review of their anti fire arrangements to take them in hand The memorandum can be obtained from Geo Barber and Sons Ltd, 23, Furnival Street E C 4 price 6d net post free

The French Minister of Public Health having sought the opinion of the Academy of Medicine about the dangers of poisoning to which workers employed on the manufacture of impermeable clothing are exposed the Academy has appointed a Commission of Inquiry

For several years past May 12th Florence Nightingale's birthday has been observed as Red Cross Day throughout the Empire and collections have been made on that day for various services of the British Red Cross Society As May 12th is the date approved by the King for his Coronation it has been decided to hold the Flag Day on June 8th in view of the opinion expressed by the police and others concerned that great difficulties would attend a street collection on the day of the Coronation

The fifteenth Benjamin Ward Richardson Lecture on the supervision of the nation's food supply was given last November by Lieut.-Colonel Gerald Leighton formerly of the Department of Health for Scotland The full text of the lecture has now been issued from the office of the Royal Sanitary Institute 90 Buckingham Palace Road, S W 1

Dr Maude Abbott the well known authority on congenital heart disease, has received the doctorate of law of McGill University where she was formerly professor in the faculty of medicine

Dr Donal Sheehan, at present lecturer in neurological anatomy at Manchester University has been appointed senior professor of anatomy and director of the anatomical laboratories of the College of Medicine in the University of New York

According to Dr Tricot Royer, honorary president of the Federation Medicale Belge the number of doctors in Belgium has risen from 3,000 in 1900 to 6 000 in 1936 This means one doctor for every 1,333 inhabitants the population of Belgium being put at eight millions There is one doctor for every 800 persons in the towns with a population of more than 5,000, and one doctor for every 500 to 600 inhabitants of the four university towns On the average one doctor dies every week in Belgium and the universities turn out one doctor a day

In Paris there is one doctor to every 576 inhabitants, the average for the whole of France being 1 to every 1 600 There are some regions in which there is only one doctor to every 78,000 and in Finistere one to every 13,700 inhabitants

On the occasion of the centenary of the birth of the famous German Professor Ernst von Bergmann on December 16th a memorial exhibition was held in the Kaiserin Friedrich Haus Berlin in which articles illustrating anaesthesia x rays antisepsis asepsis and war surgery were displayed

In celebration of his seventy fifth birthday Professor August Bier has been awarded the shield of nobility by the Chancellor of the Reich

QUERIES AND ANSWERS

Mongolism

J D writes Have any readers used pituitrin or thyroid extract in the treatment of mongolism with favourable results? Also is any other medicinal form of treatment likely to benefit?

School for Psychoneurotic Girl

X Z X asks for information concerning a school or schools suitable for a girl of 14 suffering from psychoneurosis (somnambulism and automatism) where psychological treatment would be given

Nocturnal Cramp

'ALPHA writes I thank the readers who either in your columns or by private letters have answered my query about nocturnal cramp I have taken certain remedies recommended but without effect and I have noted certain recommendations which had already been tried without effect The only course which might be successful is to study the *cause* in a clinic with a laboratory attached It may then be possible to treat it by prevention rather than by antidotes

Vasospasm after Charcoal Treatment

Dr ELI DAVIS (London S W 10) writes in reply to Mr A F Cowan (*Journal* December 12th 1936 p 1241) on intravenous charcoal treatment I would point out that in a series of 800 intravenous charcoal injections (see *Brit J Derm Syph* (1936) 48 484 and *Lancet* (1936) 2 1266) many of them given for septic conditions the reaction he describes did not occur although various other reactions were noted

LETTERS, NOTES, ETC

Remedy for Sea sickness

Dr W H DIEFFENBACH (New York City) writes to say that for thirty years he has prescribed the following treatment to patients about to sail across the Atlantic The remedy consists of apomorphine m 1 m 10 000 solution dispensed in two 8 ounce bottles for the to and fro trip The patient is instructed to sip the medicine slowly whenever the tendency to vomiting or nausea occurs There is immediate relief and the sipping can be resumed if the symptoms recur Judging from the yearly demand for this prescription the remedy is efficient.

Medical Work in Newfoundland

The tenth annual report of the Grenfell Association of Great Britain and Ireland reviews the medical work undertaken in Labrador and Northern Newfoundland It comprises the

administration of five hospitals, six nursing stations, four orphanage boarding schools and twelve summer schools, the control of various hospital and other steamers, and the promoting of industrial, educational, and agricultural work Lecturing tours in England have been conducted during the year to instruct the public in the vast scope of the undertaking and the excellent results achieved, some details of these are included in this report For instance, 818 in-patients have been treated in St Anthony's Hospital, and of the 3,468 out-patients dealt with the large majority were visited in their homes by doctors and nurses travelling by boat or by dog teams Dr C Hogarth Forsyth contributes a graphic account of the nature of the activities carried on at St Mary's River Station, Labrador, with special reference to the educational and medical treatment of children and the journeys of the staff to outlying districts Illness prevented Sir Wilfred Grenfell from contributing his usual account, but this omission has given an opportunity for others of his devoted band to reveal how difficulties are being overcome in developing medical and other amenities in a lonely part of the Empire

Painless Labour

Mr S M WELLS, F R C S Ed (Valparaiso), writes Some years ago I had a case similar to the one reported in the *Journal* of September 26th, 1936 (p 627), by Dr T B Prys-Jones, but of course the circumstances were not the same A primipara who had engaged me to attend her had her nurse sleeping in the house for convenience One morning at about 3 o clock I was called urgently by the nurse saying that the child was about to be born On my arrival the patient said she had gone to sleep as usual the night before Shortly before I was called she woke up with a feeling that the bowels were going to move She went to the w c, and felt a lot of water" come away, she had no pain She called the nurse to tell her what had happened On looking, the nurse saw the perineum was bulging, the child was born within half an hour of my arrival in the house

The Saliva in Diphtheria

Dr CHARLES J HILL AITKEN (Rotherham) writes We are warned that, in taking a swab from a case of suspected diphtheria we must avoid getting the swab covered with saliva The uselessness of a swab so covered was brought home to me when a small child in whose case the laboratory report was "negative" died of acute heart failure a day or two after the report came through The swab was taken under great difficulty, and I could see it was covered with saliva It strikes me that, if the micro organism of diphtheria will not grow under the favourable circumstances of the laboratory because of saliva, the organism of diphtheria exploded into the air from a coughing patient will not have much chance of carrying infection, provided the inhibiting saliva is enveloping the organism Further, the saliva bathing the tonsils will also act locally as an inhibitory agent and the patient supply his or her natural antiseptic There are no doubt means by which the saliva can be encouraged to flow, and these means should be adopted, of course, to those found by experience to be of

Nursery Schools for Distressed Areas

A report on emergency nursery schools for children in the distressed areas is issued by the Save the Children Fund, 20, Gordon Square, London, W C 1 This describes the work done for some three years past in establishing and maintaining nursery schools for children aged 2 to 5 who are in special danger of suffering by reason of the economic situation Nursery schools have been set up under the auspices of the Fund at Newcastle, North Shields Sunderland, Middlesbrough, and Leeds in the Northern counties, at Merthyr Tydfil and Brynmawr in South Wales, and at Hoxton in London They have been the subject of commendation in the official report of the Chief Medical Officer of the Ministry of Health, and the Commissioner for the Special Areas in England and Wales has agreed to make grants to the Emergency Open-air Nurseries Committee of the Save the Children Fund for the provision and equipment of further nursery schools in the Special Areas

The Criminology of Twins

The hereditary factor in criminal behaviour is being given increasing attention by criminologists especially on the Continent Dr Friedrich Stumpfl (*Die Ursprunge des Verbrechens*, Leipzig Georg Thieme, M 5 80) considers that one of the most promising lines of approach to the understanding of criminal heredity is the study of twins His book consists chiefly of an account of the criminal history of various pairs of twins one or both of whom has committed crime He concludes, among other things, that similarity of twins is a matter of degree Concordance of the first degree, in his classification means that both twins are convicted of crime Concordance of the second degree—similarity in the gravity of the offence—is shown by the conviction of both partners either together or on a series of later occasions Concordance of the third degree is when the partners tend to commit the same offences The fourth and fifth degrees concern respectively similarity of social behaviour and its results, which may not in themselves be unlawful, and similarity of the deeper characteristics of the psyche Discordance is similarly graded Dr Stumpfl draws a sharp distinction between the complete similarity of disposition observed in uniovular as opposed to the complete dissimilarity of binovular twins The uniovular recidivist is surprisingly similar to his twin through all stages of concordance It is also striking that offenders with only one conviction nearly always differ from one another in the manner of their offence, although there is no pronounced difference in this respect between similar and dissimilar twins Uniovular offenders of this class are more alike in their offences than binovular offenders Dr Stumpfl's chief object is to distinguish between those criminals who are capable of being influenced by proper treatment and those who are not For the latter he advocates sterilization, the study of the former should, he thinks, be the basis of a new constructive science of penology

Switzerland in Winter

The influx of British visitors to Switzerland this winter (writes a medical correspondent) is much greater than for several years past, owing no doubt to the recent depreciation of the Swiss franc and the correspondingly greater purchasing power of the pound sterling Many of the hotels in places celebrated for winter sports have had to cater for large skiing and skating parties, and over the Christmas week these enjoyed brilliant sunshine throughout the greater part of Switzerland, although the warmth of the sun tended to make the surface of the snow rather hard for perfect ski running These conditions will be remedied by the further fall of snow expected soon Of greater importance from the therapeutic point of view is the fact that patients suffering from tuberculosis can now enjoy, at reasonable cost, the curative benefits of sun and altitude which the Swiss resorts, like Davos, Leysin, and Montana, provide At Leysin the clinics of Dr Rollier show an increasing number of English patients, and several of the clinics which had of late been temporarily closed have been recently reopened It may be recalled that Dr Rollier, who has been one of the most successful exponents of the conservative treatment of bone and joint tuberculosis by general exposure to sunlight and special orthopaedic appliances, inaugurated these methods at Leysin some thirty-three years ago

Guy's Hospital Gazette A Jubilee

Guy's *Gazette* has celebrated its jubilee with a special number that will be of interest to medical readers whether they are Guy's men or not Dr L G Housden, who was editor in 1925, points out that it was the first gazette to be run by students of a London hospital, the second to appear coming from St Thomas's It was suspended in 1880 as a result of a dispute between the editor and the governors —or, as the *Gazette* put it, of "an excess of zeal' Since its revival in 1887 the *Gazette* has progressed from strength to strength, and is now a model of what a hospital magazine should be Among the many interesting contributions in the jubilee issue of December 19th are The History of the Physical Society," by Dr J M H Campbell 'Students and Politics," by Mr H L Eason, 'Dickens's Medical Students,' by Mr T B Layton, and "Ah, My Boy!", by Wing Commander H M Stanley Turner, who unfolds a tale that is worth telling

British Pharmacopoeia Addendum 1936

The official publishers (Constable and Co Ltd, 10-12, Orange Street, London, W C 2) inform us that copies of the *Addendum 1936* to the *British Pharmacopoeia 1932* are now available, price 5s each *plus postage (inland 6d, abroad 7d)* An editorial article on the *Addendum* which became official on December 29th 1936, was published in our issue of October 24th, 1936 (p 826)

Prostatic Hypertrophy

Clinical report

I have had another case which has responded favourably to the treatment by Opocaps Prostatic The patient aet 73 came to consult me about 10 months ago He had been suffering severe urinary discomforts for several years for which consultants had recommended prostatectomy as the only means of relief but he had definitely refused to undergo an operation He had a constant desire for micturition and had reached the stage of almost complete incontinence By rectal examination I found a much enlarged prostate of the soft spongy type which was pressing on to the rectum His condition was such that I had to tell him that he had left it too late for medical treatment and I advised him to have his prostate removed as early as possible He greatly dreaded an operation and begged me to do what I could for him and said he was prepared to endure his discomforts for a further two or three months if I would only put him under the treatment which I had proved successful in other cases With practically no hope of success I prescribed Opocaps Prostatic (B O C) and was surprised when he reported about two months later that there was a considerable improvement in his condition the desire for micturition being much reduced Since then there has been a gradual improvement and after 8 months treatment he is able to get about during the day with but slight urinary inconvenience and is disturbed only about twice nightly There is I find some reduction in the size of the enlargement He will continue the treatment for a further period

My other four cases are still doing well and so far have not relapsed in any way although some of them were treated two or three years ago MRCS LRCP

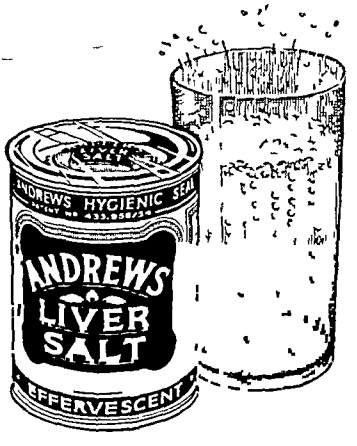
Children's Alimentary Disorders

Among the commonest ailments met with in general practice are disorders of the alimentary tract in children. These are often due to lack of insistence by the parent on regular habit, and in addition to this, may also be divided into two groups—*primary*, due to faulty feeding; and *secondary*, due to disorders in some other part of the child's system.

The primary group might again be sub divided :—



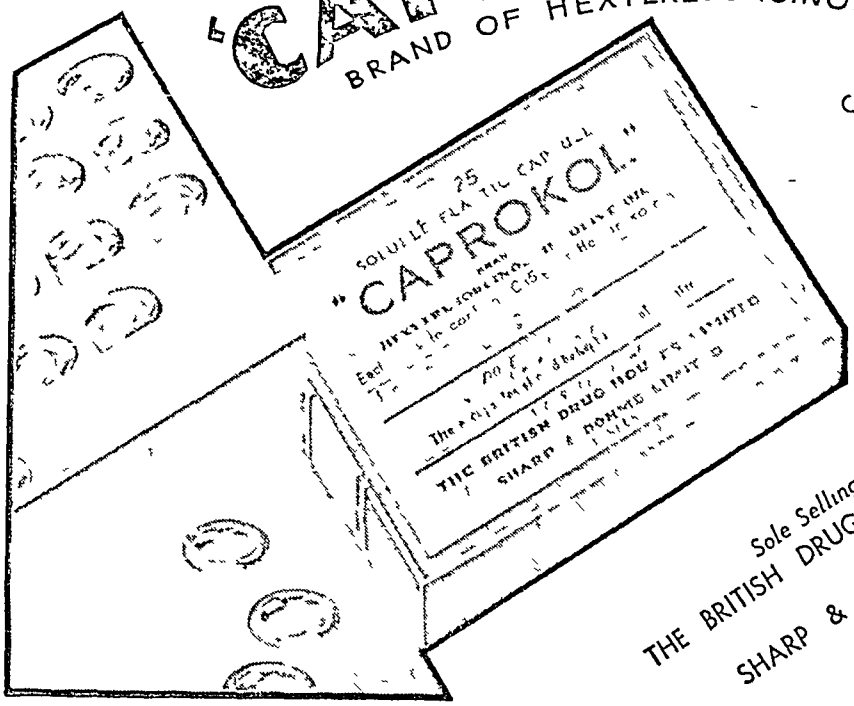
(a) Insufficient food, or variety, i.e. the "difficult" child
(b) Overfeeding, irregularity, improper mixtures of food

These result in inertia of the bowels, with peevishness, or a catarrh with furred tongue, abdominal discomfort, and fetid motions.

Disorders in the secondary group are frequently masked by the symptoms of the causative disease, such as the infectious and respiratory diseases, nasal and faucial infections, dentitions, etc. Early treatment is advisable.

An excellent treatment in either group is a course of ANDREWS LIVER SALT because

(1) Children like its merry sparkle and pleasant taste
(2) It clears the bowels promptly, without griping and residual symptoms
(3) It is a sparkling drink which cleans the mouth and improves appetite, because it assists removal of excess of mucus from the stomach.
(4) It is not habit-forming, and when the system is corrected, can be withheld.



An 8 ounce Tin will be sent free, on request to any member of the Medical Profession.

VITA GRAPE JUICE

The advice to send the anaemic patient to a Vineyard and feed her continually and liberally with fresh grapes is one few families, now-a-days, are wealthy enough to heed Yet the grape is well authenticated for all nutritional maladies For that reason we invite your interest in VITA, not as a substitute, but as The Real Thing Concentrated by a low temperature process, VITA Pure Vineyard Grape Juice retains the therapeutic power of the living fruit, because its ferments are alive and vigorous, its vitamins unchanged. Non-alcoholic and highly concentrated, a tablespoonful diluted with water is a recommended dose

A sample bottle is available to the practitioner free on request

VITA PRODUCTS LTD, 39-45, FINSBURY SQUARE, LONDON, E C 2

A purified fraction of liver extract possessing remarkable hæmopoietic properties

NEO-HEPATEX

(PARENTERAL)

For intramuscular or intravenous use

Neo-Hepatex (parenteral) is the result of an original process designed to conserve the maximum amount of the active hæmopoietic fraction of liver, and is prepared under the supervision of a staff of biologists with ten years' experience in research work on liver extracts

In addition, each batch is clinically tested in hospital This ensures the high and consistent clinical activity which has made Neo-Hepatex an accepted standard in parenteral liver therapy the world over A copy of the relative clinical test chart is enclosed in each box

Neo-Hepatex may be administered in any dosage demanded by the condition of the patient, its clinical potency enabling the clinician to give a more than adequate dosage in small volume

Neo-Hepatex is issued in Ampoules

Boxes of 6 x 1 cc - 5/- 6 x 2 cc - 7/6 3 x 4 cc - 6/6

The high potency of Neo-Hepatex renders it most economical in cost

FOR THE PROPHYLAXIS OF HAYFEVER

Immunization against grass pollen toxin, the specific causative agent in hayfever, is best accomplished by a long succession of prophylactic injections commencing early in the Spring and continued until a few days prior to the commencement of the hayfever season Provided a sufficiently high dose is reached, patients previously highly sensitive to grass pollen can pass through the hayfever season with complete immunity from symptoms

The frequency of inoculations will depend upon the time available When injections are not commenced until late in March, a dose should be given every day If treatment is delayed until May, as many as three injections daily may be necessary

For patients who experience only mild attacks of hayfever, amelioration of the symptoms during the summer months can often be secured by far fewer inoculations than are required for the complete desensitization of severe cases

"Pollaccine" is an extract of grass pollen prepared in the Laboratories of the Inoculation Department (Founder, Sir A E Wright, MD, FRS) of St Mary's Hospital, London, and is considered to be polyvalent for the pollen of all grasses

Further details concerning its use for the prophylaxis of hayfever will be furnished on request

Nutritional Anaemia

Brand Colloidal Iron Tonic

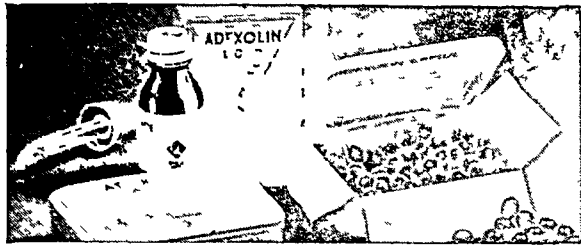
In women, the incidence of anaemia is higher than in men because the physiologic demands for iron during menstruation and pregnancy are not satisfied by a diet which suffices for men Iron must be added

In Ovoferrin, metallic iron is so combined with a protective protein colloid, as to constitute a most efficient and palatable haematinic

Ovoferrin does not irritate the mouth or stain the teeth, it does not constipate and is readily taken by children and by gravidae with sensitive stomach and nerves

It stimulates the jaded appetite and often induces intestinal peristalsis In old age, Ovoferrin acts as a stimulating general tonic

The adult dose—a tablespoonful in milk or water, contains one gram of metallic iron in easily assimilable form, for children, the dose is two teaspoonfuls



Ovoferrin is prescribed in 11 ounce bottles If you have not used Ovoferrin in your practice, we shall be pleased to send you a trial bottle on request.

"ALOCOL"

Colloidal Hydroxide of Aluminium

Improved Antacid Therapy

SODIUM BICARBONATE, bismuth salts and other time honoured antacids having each proved to possess individual disadvantages, an agent such as "Alocol" which combines the best therapeutic features of these with intrinsic merits of its own, must be of interest to the physician

'Alocol' is a powerful antacid agent which forms with the stomach contents a colloidal jelly with the power of adsorbing free hydrochloric acid, thus fixing it and eliminating it from the system It has a remarkably soothing effect on the inflamed or irritated gastric mucosa and is, therefore, rapidly effective in relieving pain Being non absorbable "Alocol" is free from any risk of 'alkalosis"

'Alocol' can be prescribed with confidence in all cases where alkaline therapy is indicated Issued in tablet and powder form

Complete chemical history of 'Alocol' with convincing clinical reports and supply for trial sent free to physicians on request

A. WANDER, Ltd, Manufacturing Chemists,
184, Queen's Gate, London, S W 7.

Works KING'S LANGLEY, HERTFORDSHIRE M257

FOR EFFECTIVE CONTROL OF PAIN

AMONG the many and diverse analgesics which have been evolved by modern chemical research acetyl salicylic acid retains its reputation as one of the safest and most effective Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has however caused many to hesitate to employ it as widely as it deserves Exhaustive trial in hospital and private practice proves that Alasil definitely solves the problem of administering acetyl salicylic acid in an effective form being free from the risk of irritating the stomach or bowels or of causing general reactions

A supply for clinical trial with full descriptive literature sent free on request

In 'Alasil" the desirable therapeutic effects of acetyl salicylic acid are well exhibited by its calcium acetyl salicylate moiety while the presence of "Alocol" (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid obviates any tendency to gastric irritation The superior absorbability of "Alasil" over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation "Alasil" can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds

Pneumonia should be typed!

ANTIPNEUMOCOCCIC RABBIT TYPING SERA

Lederle

CLINICAL ASPECTS do not serve to distinguish the different types of pneumococcus infections

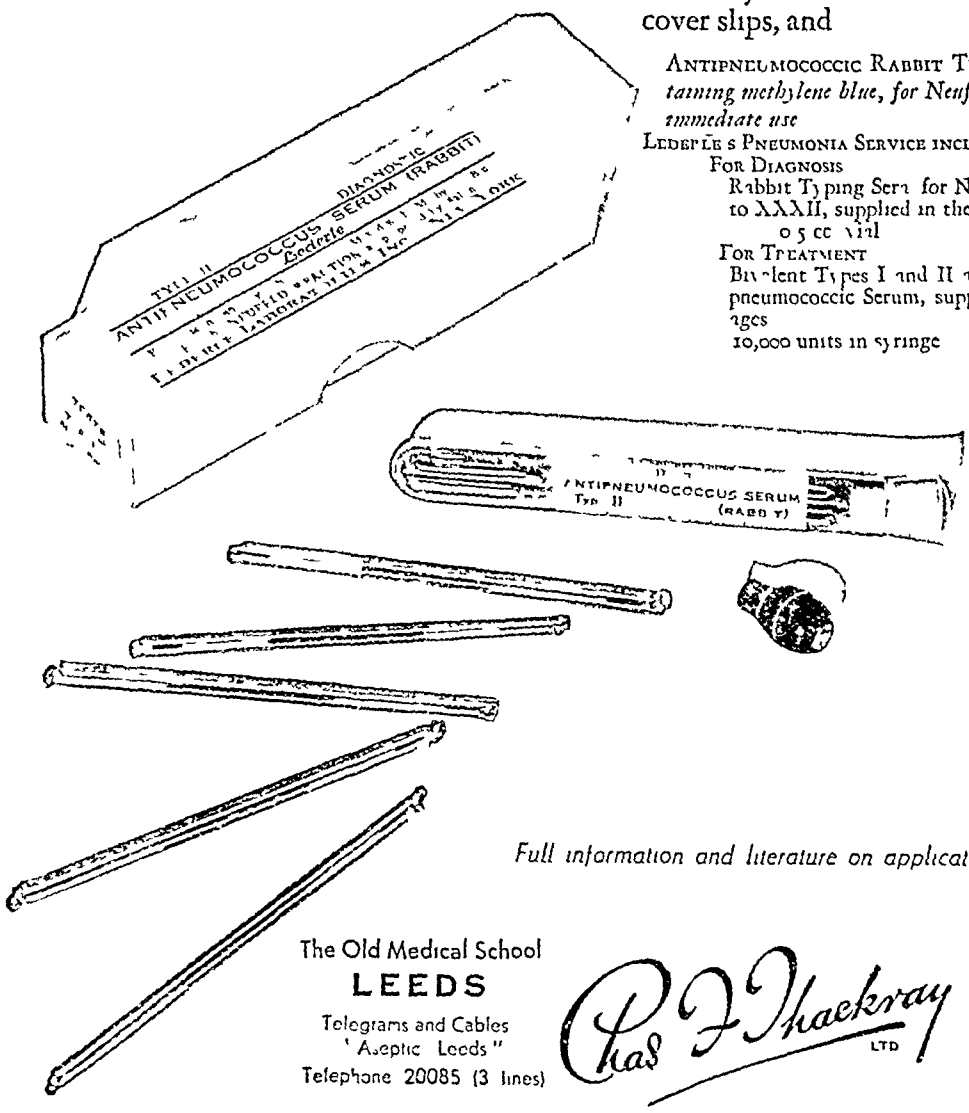
Not infrequently a striking result in serum therapy has been observed in atypical pneumonia considered not pneumococcal before the type was determined

The Neufeld method, for immediate pneumococcus typing directly from sputum, represents one of the most important advances in modern serum therapy It is simple, accurate and permits of a diagnosis being made within a few minutes' time The method may be employed by any physician once the technique involved is learned, or typing may be done through the aid of a nearby hospital or laboratory Materials necessary for the test are a microscope, slide cover slips, and

ANTIPNEUMOCOCCIC RABBIT TYPING SERA *Lederle containing methylene blue, for Neufeld Reaction Test, ready for immediate use*

LEDERLE'S PNEUMONIA SERVICE INCLUDES

FOR DIAGNOSIS



Rabbit Typing Sera for Neufeld Reaction, for Types I to XXXII, supplied in the following packages

0·5 cc vial — 5 capillary tubes

In Convalescence

THE COMMONEST condition which the physician meets is, after all, convalescence It follows every illness where there is recovery, and it often presents problems as puzzling as the disease itself

Neuro Phosphates (Eskay Brand) is the ideal tonic for shortening and brightening the period of convalescence It is rapid in results, and its extremely pleasant taste ensures the patient's willing co operation

In old and young alike, Neuro Phosphates stimulates the appetite, maintains the system's tone, and helps to produce an optimistic outlook

NEURO PHOSPHATES

(ESKAY BRAND)

Each dose (two teaspoonfuls) contains in acid state sodium glycerophosphate 2 gr calcium glycerophosphate 2 gr strychnine glycerophosphate 1/64 gr

Distributed by MENLEY & JAMES LTD, 64, HATTON GARDEN, LONDON, E C 1, for Smith, Kline & French Laboratories

Non-irritant Iodine

Liquid "Iodex" is of marked service in nasal catarrh, pharyngitis, tonsillitis, and in pre- and post-operative conditions of the nose and throat It may be sprayed upon the throat or into the nasal or nasal passages, with entire confidence in its suitability and efficiency, and its markedly resolvent properties and antiseptic virtues The irritating and corrosive drawbacks of the ordinary iodine solutions are entirely eliminated

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

1 BCG Vaccination

I HOLMGREN (*Hygiea Stockh* October 31st 1936 p 689) gives an account of his experiences with a Swedish brand of BCG prepared by Wassen of Gothenburg It contains 0 5 mg of bacilli per c cm , and the author gives from 0 1 to 0 5 mg at a single dose He prefers the subcutaneous to the other routes, at any rate for adults and with an experience of some thousands of these injections he has come to the conclusion that they are perfectly innocuous as well as being of real value in the prevention of tuberculosis Even when the subcutaneous route is chosen an abscess may develop but this vexatious though harmless, accident may be rendered quite rare if care is taken to inject small quantities at a time and to space them at long intervals The more superficial an injection the greater is the chance of an abscess developing and it is most unlikely to follow an injection if this is made deep in the subcutaneous tissues or even into the muscles Professor Holmgren has given some 200 intravenous injections of BCG and has never seen any more serious reaction thereto than a transitory rise of temperature As for the discomforts of an occasional abscess following a subcutaneous or intracutaneous injection consolation should be sought in the reflection that immunity to tuberculosis is enhanced thereby Professor Holmgren publishes in one of his tables the tuberculosis morbidity in the staff of his hospital in Stockholm between 1930 and 1935 and he insists that the fourteen cases of pulmonary tuberculosis and fifteen cases of other forms of tuberculosis in his staff were twenty nine too many He is accordingly of the opinion that every tuberculin negative newly appointed member of his staff should be vaccinated with BCG and he asks if it would not also be desirable to vaccinate the tuberculin positive also with BCG on joining the staff as the immunity they already enjoy is only relative and can assuredly be increased by BCG Of late years Professor Holmgren has had considerable experience of BCG vaccination of persons with clinical signs of tuberculosis and he finds such treatment is attended by no risks

2 Differential Diagnosis of Arthritis

In contributing to a symposium on rheumatoid and arthritic diseases R H BOOTS (*J Lab clin Med* October 1936 p 14) reviews the essential features in the differential diagnosis of rheumatoid and osteo-arthritis The first is essentially a multiple arthritis apparently of infective origin while osteo arthritis is a degenerative process seen mostly in the middle aged and elderly The typical clinical pictures of the two diseases differ but diagnosis may be difficult in atypical cases and especially in the early stages or when one type is superimposed on the other Diagnosis should only be made after extended observations and examinations All the pathological features are rarely found in any given case Rheumatoid arthritis which embraces atrophic proliferative, and chronic infective types is most common in temperate climates and rare in the Tropics There is usually a personal and family rheumatoid history Onset is generally subacute, with migratory pains and occurs at any age but between 20 and 50 in over 80 per cent of cases Patients are usually undernourished and anaemic Joint involvement is symmetrical and generalized there being periarticular swelling in the early stages followed by ankylosis and deformity with marked muscular atrophy There are atrophic changes in the skin and occasionally psoriasis Subcutaneous nodules are seen in 15 to 20 per cent of cases Over 50 per cent of typical cases give a positive agglutination reaction with haemolytic streptococci The sedimentation rate is usually greatly increased and there is osteoporosis with narrowing of joint spaces bone destruction, ankylosis and deformity In osteo arthritis which includes hypertrophic degenerative, menopausal and senile types climate is unimportant as a factor and there is often a family history of a similar type of arthritis, but no characteristic personal history The disease is rare before 40 and in women is most common at the menopause Onset is insidious and not accompanied by pains Patients are usually well nourished often obese The weight bearing joints are often affected and the distal phalangeal joints There is early slight articular enlargement becoming more pronounced later Ankylosis is slight and never complete Hebe den s nodes are found but muscular atrophy and cutaneous changes are not characteristic The agglutination test is never definitely positive and the sedimentation rate is above normal There is no osteoporosis slight lipping of joint margins occurs early becoming marked later and osteophytes may then be found The plasma cholesterol tends to be low in rheumatoid arthritis and high in osteo arthritis Non-filamented neutrophils are increased in rheumatoid arthritis normal in number in osteo arthritis The author discusses the aetiology of the diseases and concludes that while rheumatoid arthritis may be connected with a haemolytic streptococcal infection together with other factors there seems to be no specific aetiology of osteo arthritis

Surgery

3 Chronic Thyroiditis

A E WALLIS (*Arch Surg Chicago* October 1936 p 545) gives an analysis of 100 cases of chronic inflammation of the thyroid gland seen at the surgical clinic and Sanatorium Victoria in Berne The condition is un *common and is only recognized* post operatively as the clinical symptoms do not lead to early diagnosis In sixty six cases there were no symptoms of inflammation and only slight dyspnoea In the majority of cases there was a firm and nodular enlargement of the thyroid gland In nineteen cases there were symptoms which suggested inflammation such as swelling tenderness and pain both local on pressure and radiating Dyspnoea and dysphagia were mild in degree and the enlargement of the thyroid gland was diffuse There were fifteen cases which were classed as the hyperthyreotic group The increase in the basal metabolic rate lay between −18 and −48 Palpitation, loss of weight and tremor were noticed in several cases Enlargement of the thyroid gland was of the nodular type It is considered that the cause of chronic thyroiditis is a bacterial toxic one and that pre existing goitre is a factor in the development of chronic inflammation of the thyroid gland Differentiation between thyroiditis and *strumitis is difficult* if an inflammatory lesion develops in a normal gland it may be said to be thyroiditis if in a goitrous gland strumitis The prognosis is good there were only three cases in which a complication such as suppuration and the formation of a fistula occurred Thyroidectomy was carried out in all cases in forty three instances on the right lobe in seventeen on the left lobe and in forty cases on both lobes Recovery in all cases was complete

4 Albee s Operation for Pott s Disease

GEORGES LECLERC (*Presse med* October 28th 1936, p 1684) gives details and end results in a series of twenty six cases of adults operated on for Pott s disease by the Albee method The majority of cases received treatment less than two years from the onset of the disease and the technique consisted in dividing the spinous processes of the vertebrae and introducing a graft between the two split surfaces

The graft was taken from the tibia and cut with an electric saw, and only in the earlier cases was a rib used The aim was to produce ankylosis of the two vertebrae above and below the tuberculous area Post-operative immobilization in a recumbent position should be for as long as possible, even up to eighteen months It is pointed out that Albee's statistics showed 90 per cent of excellent or good results These only included the end-result of the cases up to one year, and after this period the percentage of successful results falls In the twenty-six cases which have been followed up for a minimum of three years there were sixteen that showed an excellent result and three that were good, or 73 per cent for the two groups together In certain cases radiography shows the fusion of the diseased vertebrae, and in these cases there is probably a permanent cure, but in the majority of cases, even those which appear clinically successful, the affected area presents a less reassuring picture The shadow in these cases is not homogeneous and appears mottled, suggesting that the tuberculous focus may be still active If these cases are excluded the percentage of successful results falls to 23 Early treatment plays an important part in the prognosis of the disease The first year after the onset of the disease is the most favourable time for operation In cases which are not treated until later the post-operative period of immobilization must be correspondingly longer Frequent x-ray examinations should be made even after the patient appears to be cured

Therapeutics

5 Prontosil Treatment of Erysipelas

J E MINKENHOF (*Nederl Tijdschr Geneesk*, November 21st, 1936, p 5197) reviews the literature and records his observations on thirty-five cases of erysipelas at the Wilhelmina Hospital, Amsterdam, treated by prontosil The drug was administered exclusively in the form of tablets, the dosage being as follows first three days 0 3 gramme seven times daily, second three days 0 3 gramme five times daily, third three days 0 3 gramme thrice daily, and last three days 0 15 gramme thrice daily Children in the first year of life were given 0 15 gramme twice daily for the second three days, and so on Children from 1 to 4 years usually had 0 9 gramme daily for the first three days The urine always assumed an orange-red colour for one to two hours after administration of the first doses, and on the following days a darker red, while several days elapsed after prontosil had been stopped before the urine assumed its normal colour No really bad effects were observed Comparison with thirty-five controls not treated by prontosil showed that the drug considerably shortened the duration of the disease, though it did not prevent the occurrence of complications

6 Bismuth in Bejel

E HUDSON and S CROSLEY (*J trop Med Hyg* November 2nd, 1936, p 246) describe their results of treatment of 1,000 cases of endemic syphilis with bismuth Endemic syphilis, known in Syria as bejel, is a non-venereal condition, contracted by or from children A muco-cutaneous eruption disappearing spontaneously within a year is the first manifestation It is followed by a latent period Late lesions may take the form of muco-cutaneous relapses or gummatous ulcerations The general constitution remains unaffected Positive precipitation and complement fixations occur, and spirochaetes indistinguishable from *Treponema pallidum* are found in open lesions Eradication of the disease in the community by controlling the infectiousness of individuals with open lesions was the objective of therapy Bismuth in the form of sodium bismuth tartrate or bismuth salicylate was administered in daily intramuscular injections each patient receiving an average total of 0 75 gramme of the metal Bismuth was found to be less toxic and more effective than mercury, more suitable to the conditions of bejel than the arsenicals It was found to be easy to administer, less hazardous than other preparations, more prolonged in its effects a stimulator of the body defences, and cheap (the cost of each injection being less than one halfpenny) Of their 1 000 patients, 49 per cent were improved 28 per cent were healed, 10 per cent were unaffected and in 13 per cent the result was unknown Recurrence of healed lesions occurred, but healing was again secured with bismuth The authors believe that eradication of the disease could be secured in ten to fifteen years if mass treatment, including treatment of all children up to the age of 15, and all adults with open sores could be enforced A large amount of suffering would be averted and *there would be a rise in the economic level of the community*

7 Ozone Treatment of Cystitis

W BIRCHER (*Munch med Wschr* October 30th, 1936 p 1792) has had entirely favourable experiences in the treatment of chronic and acute cystitis (both in males and females) by vesical insufflation with a mixture of ozone and oxygen Fisch's apparatus is used and the catheter must be of silver, not india-rubber The bladder is filled for ten seconds five times in succession, and the last filling is retained as long as possible—that is, until a burning feeling is induced This is due to hyperaemia and to a hyperoxygenization, which, however, is reversible Similar successes are reported in treatment of cysto pyelitis from the bladder The two cases recorded in detail are those of a chronic and an acute cystitis (in females) caused by *B coli* and resistant to irrigations and drug treatment

Diseases of Children

8 Arsenical Disinfection of Diphtheria Carriers

A IANCOU TURCOU DARIOU and DAVID (*Nourrisson* November, 1936, p 359) have had successful results in disinfection of infant carriers of diphtheria from intranasal instillation of insoluble arsenic compounds as recommended originally by Leleboullet Stovarsol was effective, but spirocide in a 10 per cent watery suspension is preferred, instillation being done thrice daily for five days From one to three such series of treatments are commonly required, occasionally six to eight The successful cases numbered forty-seven, one only had toxic symptoms, consisting in morbilliform and erythematous eruptions

9 Acute Gastro-intestinal Disease

R M SMITH (*New Engl J Med* October 15th, 1936, p 701) points out that in the United States the infant mortality due to gastro-intestinal disease has dropped from 20 per cent of the total infant deaths in 1915 to 0 9 per cent in 1932 The author concludes that the three most important factors in the bringing about of this situation are better artificial feeding improved care of infants and pasteurization of milk Of infants admitted to hospital 75 per cent are brought because of loss of or failure to gain weight, vomiting, or diarrhoea Smith believes that in the majority of cases the diagnosis is found in one of the following groups, mentioned in order of relative frequency and importance of causation infection, congenital anomalies, faulty environment or hygiene, improper food An accurate history, a careful physical examination, and additional laboratory data are usually sufficient to allot the cause of symptoms to one or more of the four groups Treatment depends on the cause Infection is dealt with by specific or non specific measures Maintenance or restoration of body fluids at or to their normal levels is important Infections in parts other than the gastro-intestinal tract must be sought for and treated Congenital anomalies usually require sur-

BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 20 1937

MEDICINAL KAOLIN IN FOOD POISONING

A CRITICAL SURVEY

BY

N MUTCH, M D , F R C P

Physician Guy s Hospital Lecturer and Examiner in Pharmacology London University

[WITH SPECIAL PLATE]

Kaolin is described in the *British Pharmacopoeia* as a native aluminium silicate, powdered and freed from gritty particles by elutriation The stipulated tests are however insufficient to establish its identity, chemical purity, pharmacological activity, or freedom from insoluble gritty contaminants It has acquired a wide popularity in recent years as a medicinal substance for internal use Further pharmaceutical and pharmacological inquiry is desirable

Kaolin is not a primary mineral but always a secondary decomposition product from the weathering of granite and other rocks The term is generic covering many closely related substances of compositions varying with the geological circumstances A number of hydrated silicates of aluminium which occur in nature cannot be classified as any form of kaolin at all X ray analysis and the application of optical and other physical tests show (Ross and Kerr, 1931) that there are at least three different groups of clay classified geologically as kaolin These varieties are based on kaolinite dickite, and nacrite respectively, each of which has the same chemical formula $Al_2O_3 2SiO_2 2H_2O$ Kaolinite is the most common nacrite is rare dickite clays are found in Anglesea and worked commercially in Mexico

Pharmaceutical Kaolins

The clays used therapeutically in this country have been derived chiefly from the fine china clays found in Cornwall and West Devon These clays are of the kaolinite class Other important deposits are worked in Czechoslovakia Germany France U S A and Japan

China clays differ in general from ordinary rock clays in having a whiter colour being less contaminated with extraneous minerals and in possessing less plasticity The lack of plasticity can be accounted for by the microcrystalline structure of many of their constituent particles which contrasts with the amorphous nature of other clays For this reason they are less likely to ball up and form concretions when taken internally It is suggested that the term "medicinal kaolin' should be confined to purified china clays of the kaolinite type Other types of china clay, or indeed of common clay may eventually come to be accepted as medicinal substances but present clinical experience is based on the use of kaolinite china clays, and future confusion might be avoided if, for pharmaceutical purposes the term kaolin could be reserved for china clays of kaolinite foundation

Ordinary china clay is obtained by elutriation of the crude mined material whereby the bigger particles of quartz and mica and partially altered felspar are removed Such commercial clays still contain much fine grit imperceptible to the fingers but readily detected as grittiness between the teeth Under the microscope crystals of quartz tourmaline felspar and muscovite mica can be seen dispersed through the predominant kaolinite Simple elutriation cannot achieve any greater purity than this

To obtain the colloidal clays of commerce the kaolin particles are given an electrical charge by suspension in water and the addition of a suitable electrolyte This process of *peptization* causes the kaolin to remain in suspension but the heavier grits fall to the bottom The true clay is then thrown out of suspension by flocculation with another electrolyte or by the development of an electric field When collected and dried it still contains some of the finest mica scales which have become entangled and failed to settle out, but it is no longer gritty to the teeth It is suggested that medicinal kaolin for internal use should be defined as having been freed from grit not merely by elutriation but also by peptization and flocculation or by some equivalent process yielding a high grade colloidal clay

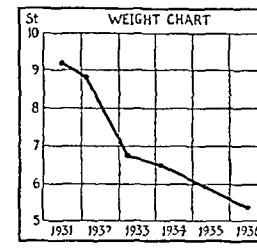
Examination of proprietary medicinal brands indicates that in certain cases the colloidal clays of commerce have been refined still further Even these are not entirely amorphous but contain microcrystalline elements of kaolinite mixed with the true argile colloidale The particles of the latter are invisible under a 1/12 in objective All kaolins purified by wet processes are contaminated by adsorbed electrolytes which affect their physical properties If suitable additional electrolytes are used to counteract the flocculating effect of those already present the strictly colloidal element will remain suspended in water indefinitely The rest will slowly settle out

Representative pharmaceutical kaolins were examined to determine (1) how closely they approached in composition to the idealized substance $Al_2Si_2O_7 2H_2O$ (2) to what extent they were contaminated by grit (3) whether they became agglutinated into a sticky clay on the addition of water

Presumed History of Infection

The actual order of events would thus seem to be as follows He probably received his tuberculous infection in early life, as most do, and was left with a latent focus which could not be recognized There is a statement in his notes that he had influenza in November, 1918 (when one of the greater epidemic waves was present), and that after that, in May, 1922, he began to show mental symptoms, but no recognizable spread of tuberculosis took place either then or up to July, 1936

It seems that when the wasting brought about by his self induced starvation had reached a certain point the old original focus, no longer held in check spread rapidly, involving a great part of both lungs within some fifty days That there was a complete lack of resistance or reaction is shown by the fact that during the six months before his death the temperature, taken night and morning, was only above normal on four single occasions and that during the last three weeks of life, when this rapid spread must have been taking place it was never raised above normal at any time This seems to be a rather striking example of an endogenous metastatic reinfection by the tubercle bacillus from within the body, due to severe loss of resistance As Davidson (1935) states Such reinfection being commonly preceded by a lowered resistance on the part of the individual



Indirectly the course of events in this man was of interest from another point of view—namely as to whether he, like other persons with sufficiently lowered resistance, might have received a reinfecting dose from without In mental hospitals and other institutions where numbers of persons are living together this possibility has always to be borne in mind, and special care is taken to remove all known cases of tuberculosis to a special block This man had been bed ridden for many months, and had not, during that time, been in contact with any known case of tuberculosis The possibility, therefore, of reinfection from without was minimal The most likely source of the sudden spread of tuberculosis in the lung seems to have been the caseating hilar gland found at the root of the right lung (Fig 1) Possibly it had ulcerated through to a bronchus with a resulting "aspiration pneumonia

Notes of Case

The patient was admitted to the South Yorkshire Mental Hospital on July 2 1929 He had had influenza in November 1918 and had been showing mental symptoms since May 1922 His father was alcoholic otherwise the family history was negative No abnormal physical signs were found in the chest on admission He was suffering from melancholia was depressed and apprehensive said he was unfit to live and was actively suicidal. His desire for death found expression in a habit of regurgitating food After his meals he used to put his finger in his throat and induce vomiting If restrained from doing this he became very resistive and threatened to do harm to himself He lost weight steadily In June 1931, he weighed 9 st 2 lb in February 1932, he weighed 8 st 12 lb in March 1933 6 st 11 lb in February 1934 6 st 7 lb and in June 1936 5 st 5 lb (See Chart) It was impossible to induce him to retain his food

On June 7 1936 a complete physical examination was made and the note on his condition reads as follows Heart sounds regular—no bruits No lesion found in chest or abdomen Remarkably free from bedsores despite extreme emaciation He had been in bed since July 1930 On sunny days he was nursed on the veranda There was no cough or sputum His temperature was taken morning and evening and was charted from February 19 1936 until his death in August of that year On only four occasions was the temperature above normal During the last three weeks of his illness there was no pyrexia at all His pulse rate was between 60 and 70 throughout and his respiration rate ranged from 18 to 22 per minute

The differential white cell count taken on June 29 1936 showed polymorphonuclears, 82 per cent lymphocytes 17 per cent and large hyaline cells, 1 per cent A specimen of his urine on June 9 contained a trace of albumin and an occasional granular tube cast The faeces were tested for tubercle bacilli on June 8 and 15 with negative findings The chest was radiographed on July 2 1936 The report reads as follows Heart normal in size and position Hila both slightly enlarged The apices light up fairly well the left

better than the right There is slight fibrosis present over the whole of both lungs but no active mottling anywhere A note on August 16 stated Is slowly degenerating both mentally and physically Appears very feeble at times—still vomits after his meals

He died on August 20 and a post mortem examination was made on the same day The body was emaciated

The pleura over the left lung was normal The lower part of the upper and upper part of the lower lobes were solid This area was clearly demarcated, it involved almost the total horizontal section of the lung and measured 5 in vertically Many areas up to 1/2 in diameter of caseation were present in the consolidation These areas had resulted in softening and cavity formation and there was a marked absence of fibrotic tissue The cavities contained thick green necrotic material, a film of this material stained by the Ziehl Neelsen method revealed a profusion of tubercle bacilli A section of the consolidated area stained with haemalum and eosin showed a diffuse caseation of the involved area of lung There was no overgrowth of fibrous tissue and no giant-cell systems were seen There were numerous alveoli containing only fibrin The section stained by the Ziehl Neelsen method showed numerous tubercle bacilli

In the right lung there were areas of trefoil necrosis in the middle lobe and the lower inch of the upper lobe but there was considerable spongy lung substance still present in the affected zone Over the diseased area of this lung there were small patches of thickened pleura and a certain amount of comparatively recent pleurisy There were also three small areas the size of a pea in this lung which had a little fibrous tissue reaction and a few giant cell systems and only in these small areas of the widely involved area in both lungs was the disease probably as much as a few months old At the root of the right lung there was a solitary caseous peribronchial gland half an inch in diameter it was darkly pigmented and distended with caseous material and appears to have been the primary focus The heart and kidneys were much atrophied There was no gross lesion of the stomach There was no dissemination of tuberculosis throughout the body

Acknowledgements

I am indebted to Sir Arthur Hall for his stimulating advice to Dr J L Grout for his opinion on the films taken and reported by Dr E M Sykes and to Mr W Vincent for the photographs I should like to express my thanks also to my colleagues who made the clinical notes and to Dr Arthur Pool medical superintendent of the South Yorkshire Mental Hospital for permission to publish the case

Davidson Maunce (1935) *Manual of Diseases of the Chest* London p 281

Composition of Kaolin

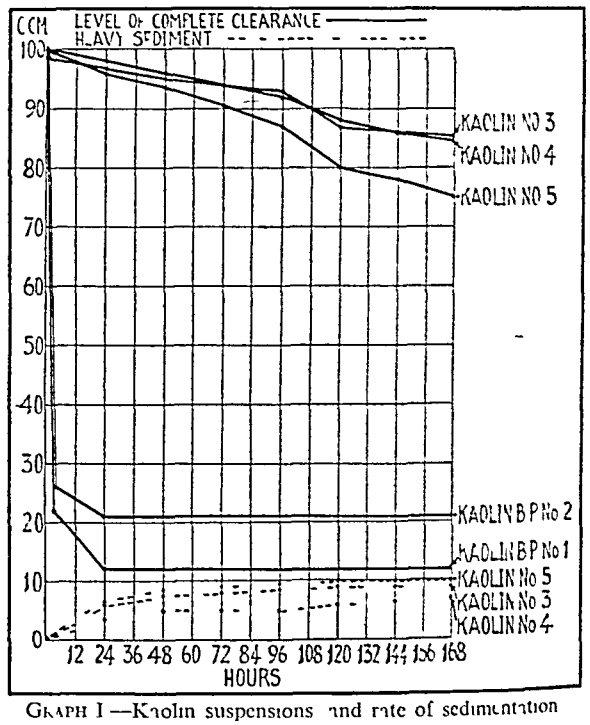
Estimations were made of aluminium, silica, magnesium, calcium, lead arsenic, soluble chloride, soluble organic matter, and moisture The results are given in Table I

TABLE I —*Quantitative Analysis (Per Cent)*

Clay	Al_2O_3	SiO_2	Fe_2O_3	CaO	MgO	Loss on Ignition	Ratio Si Al (Theoretical 1 04)
1 Kaolin *B P*	6 16	46 92	0 28	1 49	0 89	12 81	1 14
2 Kaolin *B P*	38 15	44 67	0 27	1 01	0 25	13 17	1 03
3 Collosol kaolin	36 84	48 13	0 23	0 68	0 05	13 60	1 16
4 Kaolin (Kaylene)	35 63	46 18	0 47	0 84	0 50	14 00	1 14
5 Osmo kaolin	38 46	46 47	0 12	0 51	1 20	13 22	1 06

The percentages do not furnish any direct clue to contamination by silica and mica, the constituent elements of which would merely contribute to the figures in the first two columns The calcium and magnesium, however, do indicate extraneous mineral matter, the former reaches a significant figure in No 1 and the latter in No 5

All the specimens conformed to *B P* standards for free unadsorbed lead arsenic, chlorides, and organic contaminants The ratio of Si Al 1 1 04 in the idealized formula is realized fairly adequately in every case, the closest approximation being achieved by No 2 It is suggested that neither CaO nor MgO should be present in amounts of 1 per cent or more, and that the ratio Si Al should not depart from the idealized figure for kaolinite by more than 10 per cent



Grit

Twelve samples of *B P* kaolin were purchased from various retail and wholesale houses With one solitary exception their grit content was so high as to be detectable by grinding the clay between the teeth Three medicinal kaolins sold under registered names were free from any comparable amounts All the *B P* clays were of the flocculated variety contaminated by uncompensated electrolytes so that when suspended in water they settled out rapidly into a sticky coagulum conducive to the formation of intestinal concretions The three special clays, however became peptized when water was added, and therefore remained in suspension with relatively little tendency to throw down any plastic deposit These three kaolins were selected for further survey, also two samples of *B P* kaolin bought from important wholesale houses and therefore representative of the kaolin furnished for dispensing purposes to a large section of medical practitioners and retail chemists

A certain amount of gritty matter could be obtained from every sample of kaolin by the following method The clay was mixed with water and peptized completely by the addition of sodium pyrophosphate The full physical dispersion of the kaolin secured by this means liberated small grits which had been entangled by the clay, these quickly separated out as a sandy deposit This granular debris contained much amorphous matter, made up of conglomerations of kaolinite encapsulated in humus derived from the water used in the preliminary elutriation processes carried out at the mines These were resolved by destroying the humus with nitric acid The kaolin and grit were then separated by repeptization with pyrophosphate, and the finally deposited grits were examined under the microscope

The *B P* kaolin yielded a relatively high proportion of grit and the other kaolins comparatively little The photomicrographs (Plate, Figs 1 and 2) show deposits obtained from *B P* kaolin and from one of the registered kaolins respectively A striking qualitative difference between these two deposits is apparent as well as a quantitative one The material from the registered clay consists almost entirely of very thin flat scales of mica with a hexagonal tendency Similar scales are to be seen in the *B P* kaolin deposit also but in this case they are covered over densely by small thick angular fragments of quartz and similar abrasive substances Among them are interspersed numerous irregular large black masses of crude contaminants

The sedimentation rates of the various clays were measured by filling a 100 c cm cylinder with a 5 per cent suspension in distilled water, and measuring the steady rise in the heavy deposit at the bottom and the rate of formation of the absolutely clear zone at the top of the cylinder The results are incorporated in Graphs I, II, and III,

GRAPH I —Kaolin suspensions and rate of sedimentation

representing three sets of observations on each of the five selected kaolins The *B P* kaolin settled out almost completely in an hour, but a great part of each registered kaolin remained in suspension for a week The dotted curves measure the heavy deposit of grit plus the flocculated sticky fraction of the clay The non dotted curves measure the extent to which subcolloidal dispersion occurred The radical physical difference between the two types of clay is apparent at a glance, the best figures being given by No 4

Adsorption

Commercial kaolins vary widely in their properties Even when the clays selected come from a single county —for example, Cornwall, where all have a similar origin from the felspars of the granite of the district—several different types can be found Some have physical properties which render them particularly suitable for certain purposes whilst others, poorly adapted for those objects, are specially desirable in other directions (Coon and Lewis, 1926) It is generally agreed that the therapeutic utility of kaolin taken internally is dependent on its adsorptive affinities By virtue of these it removes toxic substances from solution, modifies saprophytico chemical processes

CARCINOMA OF THE BRONCHUS IN A BOY AGED 19

BY

J GORDON HAILWOOD, M D

Late Medical Registrar Liverpool Royal Infirmary

(WITH SPECIAL PLATE)

The occurrence of carcinoma of the bronchus at the age of 19 is rare enough to be worthy of record This condition usually occurs between the ages of 40 and 70 (Simpson, 1929), although several younger cases have been reported Many writers have published series of cases of intrathoracic neoplasms with the age incidence

Cases in the Literature

I have collected all the reported series of cases which could be found in the literature, after an exhaustive search, and compiled the following table to show the age of incidence

Age	0-20	21-30	31-40	41-50	51 60	61-70	71-
Cases (2 110)	20	89	290	576	726	341	68
Percentage	0 95	4 22	1 74	27 3	34 41	16 16	3 22

These include series collected by Hill (1934), Harvey (1936), Rosedale and McKay (1936), Kramer and Som (1936), Arkin and Wagner (1936), McCrae, Funk, and Jackson (1927), Wasch and Epstein (1935), Rogers (1932), Atkin (1931), and Duguid (1927)

This table shows that the incidence is highest between the ages of 51 and 60—namely, 34 41 per cent Over 60 per cent of all cases occur between the ages of 40 and 60 Less than 1 per cent occurred below the age of 20 Unfortunately no attempt has been made in these series to relate the pathological diagnosis to the age of the patient, and it is possible that some of the younger patients have been suffering from lymphosarcoma or Hodgkin s disease rather than carcinoma Two of the writers, however, made observations of interest

Bonser (1929) reported 170 cases of intrathoracic neoplasms of which six patients were under the age of 21 She stated that two of the six were suffering from Hodgkin s disease but the other four were not classified The other writer is Atkin (1931), who from a survey of ninety-three cases suggested that oat-cell carcinoma tended to occur at an earlier age than squamous-cell carcinoma In his series three patients were aged under 30 (the youngest being 21), each of these cases proved to be oat-cell carcinoma

Clinical Record of Case

A boy electrician aged 19 had had no previous illnesses and did not suffer from bronchitis the family history was good There was no history of familial tuberculosis When first seen early in June 1936 he complained of cough sputum night sweats and loss of weight These symptoms dated from a cold and had been present for some three months On examination little could be found in the chest other than a few crepitations at the left apex The patient was referred to the tuberculosis officer for examination an x-ray film of the chest revealed no evidence of tuberculosis but there was a faint rounded shadow in the left apex

A fortnight later the patient was admitted to the Liverpool Royal Infirmary Progress of the disease during this time had been rapid The patient was now thin and emaciated he had a cough and slight sputum but no haemoptysis Large distended vessels were present on the chest and abdominal walls There was some cyanosis but the neck was not distended and the cough was not typical Several small secondary nodules were present on the chest and abdominal walls each about the size of a marble they were situated in the superficial tissues and were freely movable The liver was hard and enlarged, extending as far as the umbilicus The left side of the chest showed diminished movement, diminished vocal fremitus and vocal resonance a dull percussion note and diminished air entry with bronchial breathing at the apex These signs were most marked at the apex but were present to a less degree at the base Examination of the sputum was negative

X-ray examination of the chest revealed a large mass extending out from the left root into the lung with collapse of the lung due to bronchial obstruction An x ray examination after the introduction of lipiodol showed obstruction of the left bronchus due to a bronchogenic neoplasm These x ray films are reproduced (Special Plate) Following this discovery one of the metastases was removed from the chest wall under local anaesthesia for section The pathological report was metastasis from oat-cell carcinoma of bronchus

The patient went downhill rapidly and died six weeks after admission to hospital Unfortunately permission for a post mortem examination could not be obtained The diagnosis had, however, been fully settled by the metastasis removed for section

Commentary

The main point of interest is, of course, the age of the patient Other points to note are the complete absence of any aetiological factor and the similarity to pulmonary tuberculosis in the early stages The differential diagnosis from this disease would have been impossible in the early stages without an x-ray picture, although later the diagnosis became obvious

A final matter of interest was the occurrence of subcutaneous metastases, which are uncommon in this form of malignant disease, although metastases in general are common In this connexion it may be pointed out that in a total of 420 cases, collected by Bonser (1929) Grove and Kramer (1926), and Maxwell (1930) in which the occurrence and site of metastases are reported, only nine cases showed involvement of the subcutaneous tissues

My thanks are due to Dr Wallace Jones for permission to publish this case, and to Dr Hewer for his help with regard to the pathology

G A Metz (*Nederl Tijdschr Geneesk* January 30, 1937 p 493) records the case of a man aged 45 who developed symptoms of acute veronal poisoning after taking 9 grammes of veronal Treatment consisted in administration of strychnine nitrite, of which sixty six intravenous injections of a total of 599 mg were given in the course of eight days Delirium of six days duration set in eight days after taking the drug but subsequent recovery was uneventful Traces of veronal persisted in the urine for fourteen days after it had been taken

by adsorbing intermediate products, and is available as a surface catalyst

Great differences have been found by Rae (1928) between the adsorptive capabilities of various kaolins Hellmut Muller (1935) working in California with concentrates of mussel poison found that German kaolin (Merck) would not remove more than 50 per cent of the

GRAPH II —Kaolin suspensions and rate of sedimentation

GRAPH III —Kaolin suspensions and rate of sedimentation

toxic substance from an aqueous solution, and that activated charcoal would not remove any at all The variety of English kaolin employed in the present experiments removed the toxic substances completely In recording experiments of this kind it is therefore important to define as precisely as possible the nature of the material to which the term kaolin has been applied The common omission of authors to do so in the past has made it difficult for later workers to correlate their findings

For the purpose of the present investigation kaolin No 4 was selected as based on kaolinite, and as being uncontaminated by any excess of extraneous mineral matter (CaO and MgO content each below 1 per cent and the ratio Si Al within 10 per cent of the ideal) It had obviously been purified, not merely by elutriation but also by a method involving peptization or some kindred process and appeared to have undergone further pharmaceutical refinement Its sedimentation rate and optical appearances showed it to be exceptionally free from particles of microscopical grit It would seem therefore to approximate to the idealized mineral more closely than the other specimens examined

The range of action of a therapeutic adsorbent is quite as important as its potency Kaolin No 4 was therefore tested with a series of dyes representing several chemical groups, both crystalloids and colloids and including both acidic and basic dyes When a solution of dye is added to a suspension of kaolin it is decolorized If a standard solution of dye is added drop by drop until a faint perceptible coloration remains in the supernatant fluid the total weight of dye adsorbed at this clearance point is easily calculated The addition of further dye increases the depth of colour of the suspending fluid but does not lead to any appreciable increase in the amount adsorbed

In other words the clearance and saturation adsorptive potencies for kaolin are almost identical This contrasts strongly with magnesium trisilicate and charcoal each of which gives saturation figures considerably in excess of the clearance values (Mutch, 1936) Estimations at the clearance point are the more convenient for kaolin but for adsorbents of the magnesium silicate and charcoal types saturation figures are the only dependable ones

Table II shows the amount of each dye removed by

INDUSTRIAL ASPECT OF FRACTURES OF THE OS CALCIS *

BY

BRYAN McFARLAND, M D , F R C S Ed

(WITH SPECIAL PLATE)

From an industrial point of view the os calcis presents a problem as important as it is complex Excluding those in children two out of every hundred fractures in the body involve the os calcis and occur in wage earning men at a time when they have dependent families and can least afford the loss which may follow such an injury

TABLE I

Age	Percentage of Total (63)	Age	Percentage of Total (63)
10-15	2	45-55	25
15 25 "	1	55-65	17
25-35 "	15	65 75	7
35-45	33		

Note nearly 60% between the ages of 35 and 55 years

My own experience indicates that the loss as regards money and physical condition is very considerable, and I wondered what others had found Investigation of the literature confirmed my gloomy view

Previous Literature

Golebiewski (1897) stated that he had not seen a perfect recovery in any of fifty nine cases Cotton (1908) reported permanent disability in more than 50 per cent of examined cases In 1923 Magnuson reported that in his capacity as medical director of the Illinois Industrial Commission he had seen practically no case of fracture of the os calcis which did not result in from 30 to 75 per cent disability of the foot In 1923 also Satta stated that the disability from fractures of the os calcis might amount to as much as 80 per cent He added that in Switzerland the insurance companies settle these cases on a basis of one third total disability for a period of from two to four years

Malpas (1925) investigated the period of disability in a series of fractures at the David Lewis Northern Hospital In most of these cases no definite attempt at reduction of the fractures was made Malpas found that at that time the average period of disability was eleven months, and from a comparatively small number he concluded that irregularity of the subastragaloid joint was the deciding factor Harding (1926) estimated the average duration of disability as five months Otto J Herman (1930) reported good result in 77 per cent and a poor result in 22 per cent Funston and Hall estimated the average disability period as six months

In 1931 Bartley wrote All surgeons of much industrial experience and all industrial compensation boards are unanimous in giving to this injury a very bad prognosis His figures tend to show difference between the disability period of comminuted fractures which enter the subastragaloid joint and those which do not He performs a subcutaneous tenotomy of the tendo Achillis and almost immediate subastragaloid fixation He cites as specially good result the case of a man who went back to his occupation in five months time He does not specify his occupation, though since he fell from a roof it is probable that he was either a builder s labourer or a slater or possibly a private detective It appears that the man could support the weight of his body upon the ball of the foot and also on the heel But rather naively the surgeon remarks ' There was no defect in any of the motions of the foot or ankle except the loss of *eversion* and *inversion*

In 1932 Rudolph S Reich stated that fractures of the calcaneus still resulted in permanent disability in a discouragingly large proportion of cases He reported ten recent fractures the treatment of which involved a subcutaneous elongation of the tendo Achillis, and six weeks later a subastragaloid fixation, the most fortunate of these patients was back at work in six and a half months The average for most of the others was eight and a half months one was not back at work after two years, and was then still complaining of pain One was ten months before he went back After two years three of them were on light work only The curious point is that in nine old fracture cases there was a disability period following operation of about the same duration as the recent fracture cases—namely, six and a half months to ten months or a year Nevertheless the case of a man he had operated on eleven months previously was mentioned as being too recent to report Wilson (1933) recorded the results of fifteen recent fractures not all crush fractures into the joint, but did not indicate the disability period nor the amount of permanent incapacity

Forrester (1934) referring to the cost of this type of fracture, reported that before his newer type of treatment the average disability was from nine to sixteen months Permanent disability was about 80 per cent He claimed to have reduced the period of disability to four and a half months He elongates the tendo Achillis and keeps the patients off their feet for some time It is difficult to assess his results because all his unselected cases have the same period of disability—four months—and their functional end result is 100 per cent It is rather difficult to determine from his x ray illustrations how bad the fractures were Bohler does not denote his exact periods but is reported to have said that about 80 per cent of his patients got back to heavy work, though this may be delayed for as long as two years

At a North American meeting one speaker was very illuminative, he remarked that he had treated fractures of the os calcis in every way that had been devised and that he knew of no injury which produced as much disability He usually had a patient under his care anywhere from nine months to a lifetime, and they often never went back to work

Estimations of Cost

All authorities agree that the cost is high The total economic loss is made up of four items (1) cost to the insurance companies (2) cost to the men (3) cost to the hospitals and (4) physical deterioration

I tried to obtain estimates from insurance companies On approaching several large companies I was invariably referred to the Accident Offices Association in London where I learned, as I had been advised also by the insurance companies that they were not actually interested in fractures individually, but in types of work For instance, they insure a firm not against fractures of the os calcis but against any injury For their own sakes their statistics are concerned in the accident rate of a particular occupation rather than in the period of disability of any specific injury The same is not true of a firm which carries its own insurance but even they have little exact knowledge of the cost to them of a fracture of the os calcis

* The opening paper of the annual meeting of the British Orthopaedic Association at Manchester

1 gramme of the selected kaolin. Adsorption proved to be selective, and preference was shown for basic dyes. Nevertheless certain acidic dyes also were taken up substantially. Examples are to be seen both of the active removal of crystalloids and of colloids. In the case of colloidal dyes no attempt was made to differentiate between true adsorption and mutual flocculation.

Adsorption of Alkaloids

The adsorptive activity for alkaloids was measured by observing the smallest weight of kaolin needed to clear 10 c.cm. of a 0.1 per cent. solution of each alkaloidal salt in one hour. The results are given in Table III, in

TABLE III.—*Alkaloids*

Alkaloid	Weight of Alkaloidal Salt Removed by 1 gramme of Kaolin No. 4	Alkaloid	Weight of Alkaloidal Salt Removed by 1 gramme of Kaolin No. 4
	mg.		mg.
Apomorphine hydrochloride	5	Brucine hydrochloride	4
Atropine sulphate	5	Dionine hydrochloride	3
Cocaine hydrochloride	5	Colchicine salicylate	2
Muscarine	4	Pilocarpine nitrate	1.5
Solanine	4	Emetine hydrochloride	1.5
Strychnine hydrochloride	4	Morphine hydrochloride	1.5
Papaverine hydrochloride	4	Veratrine	1
Codeine phosphate	4	Nicotine	1

which wide variations in the relative amounts of alkaloid adsorbed are to be noted. Comparison of Tables II and III with the results given in an earlier paper (Mutch, 1936), in which magnesium trisilicate was used as the adsorbent instead of kaolin, reveals not only quantitative differences between the adsorptive potencies of these two substances, but also great qualitative divergencies in their respective ranges of selection. The order of selectivity of the two silicates is radically different both in respect of dyes and of alkaloids.

It is thus clearly impossible to foretell from dye experiments alone with what vigour an adsorbent will remove any specific toxin from solution. Assessment of clinical utility by reference to the adsorption of one dye or another is unwarranted unless supported by direct observations on the adsorption of the actual toxic bodies concerned. Kaolin has obtained wide popularity in the treatment of food poisoning. Definite food poisons were therefore taken as the basis for further observations.

Mussel Poison

Many molluscs contain a little toxic matter, which varies in amount with the season and from year to year. Hermann Sommer and Karl F. Meyer (1935) explain the sporadic outbursts of shellfish poisoning as occurring at times when the poison content has become unusually high. H. Muller (1935) recently extracted the poison, and secured a concentrate of intense toxicity. He found it one hundred times as potent as potassium cyanide, and twice as deadly as strophanthin. A standard solution of this substance, for which I am indebted to Dr. Hermann Sommer of California University, was injected intraperitoneally into twenty-five mice (20 grammes) in amounts from 0.01 c.cm. to 1 c.cm. The minimum lethal dose (M.L.D.) was found to be 0.05 c.cm. To a series of flasks each containing 10 c.cm. of this solution were added various amounts of kaolin No. 4. After shaking and allowing to stand for an hour the contents were filtered, and intraperitoneal test injections were made in mice, with the results set out in Table IV. From the figures

TABLE IV.—*Mussel Poison*

Weight of Kaolin No. 4 Added to 10 c.cm. of Mussel Poison Solution (M.L.D. = 0.05 c.cm.)	Mouse	Volume Injected Intraperitoneally	Original Toxic Content of Fluid Injected	Result
grammes		c.cm.	M.L.D.

given it is easy to calculate that 1 gramme of the adsorbent removed more than seventy-two minimum lethal doses (mouse 8) and rather less than 95 M.L.D. (mouse 9). The mean of 94 M.L.D. per gramme may be taken as the adsorption potency in respect of mussel poison.

Mushroom Poisoning

Many varieties of poisonous fungi of the mushroom type are known. In certain of them the toxic element is the alkaloid muscarine, a substance which is readily adsorbed by the kaolin used in these experiments. Various strengths of muscarine in water were treated with this adsorbent and filtered after standing for an hour. The filtrate was tested for toxicity to the frog by injection into

Owing to a series of changes in hospital appointments, I have few personal figures which I am at liberty to use, but I have investigated the patients who have attended my present hospital during the last five years The following is a table showing their occupations, the average duration of incapacity, the percentage of permanent incapacity, and the proportion of the total who were rendered permanently incapacitated for work

TABLE II

Occupation	No	Average Duration of Incapacity	Percentage of Permanent Incapacity
Labourers	24	1½ years (in 25%)	50
Scalers	2	6 months	15
Painters	2	6 months	10
Window cleaners	4	1 year (in 50%)	30
Bricklayers	2	2 years	40
Coal heavers	2	—	80
Stevedores	2	—	80
Housewives	4	5 months	10

Note the large proportion of labourers and how long their average duration of incapacity was many of them remain permanently disabled The bulk of the permanently disabled fall into this category

Bad as these figures are, they are not so bad as those in the next table, taken from patients referred to me for a medical report for legal purposes The disability period had to be estimated as a minimum and it will be seen how heavy this minimum is, the average being well over one and a half years

TABLE III

Occupation	Number	Average Minimum Period of Disability
Builder	3	13 months
Boilermaker	1	19 ,,
Chauffeur	1	19 ,,
Labourer	5	13 ,,
Marine fireman	1	9 ,,
Haulage contractor	1	21 ,,
Carter	2	9 ,,
Painter	2	19
Joiner	2	19 ,,
Shipwright	1	24
Unknown	2	21 ,,

I estimate the average cost of an os calcis fracture as follows

1 Cost to the insurance companies £150
2 Cost to the men 75
3 Cost to the hospital 20
} About £250
4 Physical deterioration cannot be estimated

Factors in the Protracted Disability

Let us consider what gives rise to this long, costly disability We are taking for granted that fractures such as that shown in Fig 1 (Special Plate) and also crack fractures without displacement or involvement of the subastragaloid joint recover comparatively quickly, with little or no permanent defect It is with the type of fracture represented in Fig 2 that we are concerned There are many factors involved medical and non-medical, but are interwoven to produce a complicated problem

One man who had sustained a typical fracture of both os calces seems to me the personification of the problem

After reduction and splinting under an anæsthetic, followed later by manipulations, he complained of the usual symptoms A surgeon acting for an insurance company arthrodesed his left subastragaloid joint (Fig 3) Some time later I arthrodesed his right subastragaloid and mid tarsal joints (Fig 4)

His complaints were little if at all lessened As far as external examination goes his feet look good The foot in which the three joints were arthrodesed is better than the foot in which only the subastragaloid fixation was undertaken He walks like a "cat on hot bricks," but a cinematograph analysis shows that all phases of walking are performed normally Would this man have been any different if his feet had been arthrodesed at first?

This patient compares very unfavourably with another who sustained a similar injury to both feet, and whose clinical and cinematograph analysis suggested very little disability five months after injury He was treated in a way I will describe later Fig 5 shows the x-ray result

This first patient differs markedly also from a man who sustains a fracture of the os calcis when not at work I remember an engineer who fell from a roof when "larking" in the dinner-hour Both his os calces were crushed, and in three months he was back at full work The same is partly true when a man is unaware of the fracture I examined a man once who had a fractured femur and os calcis, though the latter had never been recognized He was off duty for five months and returned to work, only complaining slightly of his heel

The medical and non-medical factors referred to can roughly be divided into two groups

1 Medical (*a*) attitude of the surgeon (*b*) subastragaloid arthritis, and (*c*) the type of treatment

2 Non-medical (*a*) unemployment, (*b*) influence of solicitors and doctors, (*c*) the type of man, (*d*) the type of his employment; and (*e*) the Workmen's Compensation Act So far as one can disentangle the various medical factors, it is certain that a firm and carefully optimistic attitude on the part of the surgeon has important psychological effects

Subastragaloid Arthritis

As regards my own observations and also as a result of investigating these hospital patients I have come to the conclusion that subastragaloid arthritis is not the deciding factor in the length of a man's unfitness or the severity of his permanent disability The following radiographic reproductions and notes illustrate what I mean

Fig 6—This x-ray picture was obtained three months after a comminuted fracture of the os calcis with displacement and involvement of the subastragaloid joint The patient returned to work about four months after the injury The treatment is described later

Fig 7—In this case the patient was only off duty for six months The x-ray illustration shows arthritis and deformity, yet he only had a short disability, and no symptoms at all five years afterwards His cinematograph record shows no disability

Figs 8 and 9—One side was noticed and treated the other side was not noticed at the time and was not treated The patient has no symptoms at all in the untreated side His x-ray films show that there is arthritis and deformity of an almost equal degree in both feet He complains only of the one that was treated, and his cinematograph record supports this

A lady sustained a very comminuted crush fracture of the os calcis with great displacement, she was treated in the way

the dorsal lymph sac The results are given in Table V From the data relating to frogs 6 7, and 11 it can be calculated that 12 grammes of the clay removed more

TABLE V —*Mushroom Poison (Muscarine)*

than 45 mg of muscarine from solution The adsorption potency is therefore at least 3 8 mg of muscarine per gramme.

Potato Poisoning

The alkaloid solanine occurs in the potato At times its concentration in the green shoots reaches a harmful level and outbreaks of poisoning occur Recently sixty cases and one death were reported from Cyprus (Willimott, 1933) The solanine content of the suspected potatoes amounted in certain cases to 9 mg per 100 grammes of tuber, and almost to 50 mg per 100 grammes of shoot A solution of solanine acetate was therefore prepared containing 0 1 per cent of the alkaloidal base, 10 c cm were treated with 2 grammes of the kaolin and filtered an hour later The supernatant fluid was heated on a water bath with half its volume of concentrated hydrochloric acid, and tested with Mayer's solution with almost negative results A control carried through with the original solanine solution gave a strongly positive reaction The adsorption potency of kaolin No 4 for solanine is therefore a little less than 5 mg of alkaloid per gramme of kaolin

Putrefactive Amines

Various pharmacologically active substances are evolved during the decomposition of proteins by intestinal bacteria Histamine was selected as an example of such a substance because of its wide interest to the pathologist and its therapeutic applications 0 1 per cent aqueous solutions of the phosphate were treated and filtered The filtrate and recovered kaolin resuspended in distilled water were tested for histamine by the diazo reaction The recovered kaolin gave universally strongly positive reactions but the filtrate gave negative reactions whenever 2 grammes or more of the adsorbent had been used to treat 10 c cm of the histamine solution At the clearance point 1 gramme of kaolin No 4 adsorbed 5 mg of histamine phosphate

Bacterial Toxins

An aqueous solution of dried tetanus toxin was prepared, 20 c cm were shaken with 1 gramme of the kaolin and filtered (filtrate A) Another volume was incubated at 37 C with 1 gramme of the kaolin and then filtered (filtrate B) These filtrates, the original toxin solution, and a portion of the original solution which had been incubated for an hour at 37° C were injected subcutaneously into mice in varying amounts The site chosen was the left thigh The results given in Table VI show conclusively that solutions of tetanus toxin are detoxicated by kaolin No 4

TABLE VI —*Tetanus Toxin*

Emulsions Containing Kaolin and Liquid Paraffin

It has become a common practice to counteract the constipating action of kaolin by administering it in an emulsion of liquid paraffin It has been assumed that the adsorptive action of the kaolin is unimpaired provided that the kaolin is dispersed in the watery phase of the emulsion and not in the oil itself The following experiments were devised to test the validity of this assumption

Emulsions were prepared as follows A 50 c cm liquid paraffin with 50 c cm water (total 100 c cm) and B, 50 c cm liquid paraffin 11 grammes kaolin No 4 and 44 4 c cm water (total 100 c.cm) To 50 c cm of each was added 10 c cm of a 3 per cent solution of Muller's mussel poison concentrate (M L D mouse = 0 025 c cm) After shaking and stirring the emulsions were resolved as far as possible by warming at 37° C and were filtered through a double filter paper previously well moistened with water The toxicity of the filtrates

described later Her x ray films six months later showed very considerable osteosclerosis In the neighbourhood of the sub astragaloid joint some deformity of the bone persisted She was off work only for a short period Her cinematograph analysis appeared normal (Owing to lack of space it is impossible to reproduce the x ray films)

A man sustained a crush fracture of the os calcis which resulted in severe deformity and subastragaloid arthritis but he had no disability (Lack of space prevents reproduction of the x ray films)

Another man sustained a similar injury, x ray films nine months after injury did not show any arthritis and very little deformity He has a severe disability (Lack of space again precludes illustration)

Moreover a subastragaloid arthrodesis does not necessarily stop their pain nor terminate their disability The first patient recorded in this article affords one example, and another follows herewith

Following a crush fracture a man had marked arthritis shown in an x ray film made on March 1 1932 Some time later a subastragaloid arthrodesis was performed and the result is indicated in an x ray photograph taken on September 7, 1935 (Fig 10) which also shows the amount of arthritis which has since occurred in the mid tarsal joint There was no improvement in his working capacity

Treatment

I describe later my own preference Over a number of years my observations have not led me to believe that there is much difference between the results of various other types of treatment

Non medical Factors

Unfortunately non medical factors are very important, the type of man and of his employment being paramount It is shown in Table II that a very large percentage were labourers and that they had long periods of disability Examples are given above of men with arthritis but no disability and vice versa I have come to the conclusion that from an economic point of view the type of person and his occupation matter more than the nature of the deformity or the presence of subastragaloid arthritis, a bad subject and heavy work forecasts a slow recovery, irrespective of arthritis, a good subject and good work indicates a quick recovery, even with deformity and arthritis

Other non medical difficulties are very great A most difficult point to determine is whether a man is malinger ing I think that these patients are rare There is little to be gained to day by malingering Moreover, there is consistency in complaints from widely separated men and from men who do not know the nature of their injury I have examined injured workmen for many years, and have found very little difference in the nature or extent of their complaints

The typical complaints are as follows (1) pain in the back of the heel (2) pain on the outer side of the ankle-joint (3) a feeling described as toothache' in the pad of the heel, (4) a heavy burning bursting feeling in the main part of the sole of the foot and (5) loss of spring—flattening of the heel and shortening of the leg If a man has some disability he knows that he cannot return to work in fair competition with his fellows Often too much is asked of him by the insurance company advised by a surgeon and in response the man gives back the minimum Sides are immediately formed If we could avoid the formation of those sides and obtain close co operation between the parties interested in getting the man back to work I believe that we should enormously reduce the cost to everybody The best results occur with men employed by firms who carry their own insurance, and who work in close liaison with the surgeon

How far can we influence the non medical disability factor? In two ways—by our attitude and by our treatment A sympathetic but firm and hopeful attitude must be maintained and patients must observe others around them recovering It is bad for a fresh os calcis case to meet an old chronic one The men must feel that they will completely recover and return to work able to compete fairly with their fellows

Treatment

I believe that a long period of complete absence of weight-bearing is essential By absence of weight bearing I do not mean walking in a plaster, because I do not believe that a man walking in a plaster fails to take his weight ultimately through his heel

I see no point in elongating the tendo Achillis under an anaesthetic More elongation can be obtained by bending the knee than by dividing the tendon The following is the treatment which I advocate, I have found it hopeful

With an anaesthetic the fractured bone is moulded with the hands or with mechanical pressure, and the heel is pulled down as far as possible the knee being well flexed Plaster of Paris is applied, the heel being inverted the foot plantar flexed, and the knee bent almost to a right angle The knee is included in the plaster Weight-bearing is not allowed for two and a half months, but the men are encouraged to use their intrinsic muscles This treatment is continued when the plaster is removed and before weight bearing begins Patients are allowed to get about with a crutch if only one os calcis is fractured but if both are crushed they are unfortunately laid by the heels'

The average period of disability of six patients so treated is four months It is quite possible that they were all very good subjects, but cinematograph films show very encouraging results Four were stokers and labourers

Employers and insurers must co operate with the surgeon As soon as possible work should be provided on a non competitive basis within the man's ability In other words rehabilitation schemes should be instituted Whereas centres will be unpopular and unworkable large employers of labour by pooling their available work could operate schemes giving injured men within their group suitable work as a therapeutic factor Work should not be used as a weapon against a man in minim izing his compensation

Thus would be avoided the long dead period between the times when the surgeon makes the man as fit as he can and when the man undertakes work having received some sort of settlement of what he feels is a just claim

I also suggest that no doctor or surgeon other than those treating him should be in contact with the patient and panel doctors should be legally excused from signing the out of work' certificate They have no desire to do so, but are unable to refuse because the patient will leave them for another doctor It would be simple to tell the patient that they were not allowed to sign it

I further recommend that patients who have been off work for more than nine months should have their dis ability estimated by three surgeons one on their own behalf one on behalf of the employers and one to hold the balance The decision of this tribunal should be accepted by both sides without any further discussion and should be presented to the appropriate legal authority

was tested by intraperitoneal injection into mice The results are given in Table VII

TABLE VII—*Mussel Poisoning*
(*Detoxication by Emulsions*)

Mouse	Inoculum	Volume Injected	Original Toxic Content of Fluid Injected	Result
		c cm	M L D	
1	Toxin solution after treatment with in emulsion containing kaolin No 4 and liquid paraffin	0 2	2 5	No effect
2		0 5	6	"
3		1 0	12 5	
4	Toxin solution after treatment with a simple paraffin emulsion	0 2	2 5	Dead (less than 5 minutes)
5		0 5	6	"
6		1 0	12 5	"

It is clear that a simple emulsion of liquid paraffin has *no significant detoxicating action on solutions of mussel* poison, but that similar emulsions containing kaolin No 4 in the watery phase detoxicate such solutions effectively From the data given it can be calculated that 400 M L D were used and more than 368 M L D were removed by the 5 5 grammes of the adsorbent in the 50 c cm of emulsions employed

The adsorption potency of the kaolin in this oil and watery medium is therefore greater than 67 M L D of mussel poison per gramme, which compares very favourably with the potency of the same variety of kaolin in a simple suspension of water as given earlier in the paper By repeating this experiment with stronger solutions of toxin a higher figure still could doubtless be obtained

Mushroom poison (muscarine) was used in a second test, 20 c cm of 0 2 per cent muscarine were added to 70 c cm of each of the two emulsions already employed These were incubated at 37° C to break up the emulsion, and were filtered through wet filter paper The filtrate was evaporated at room temperature in a desiccator, and the residue was taken up in a small measured amount of distilled water—concentration factor 15 A control solution of 0 2 per cent muscarine was diluted with a volume of water equivalent to that in the emulsion, it was then incubated, filtered, evaporated, and redissolved in an exactly equivalent volume of water The three final solutions were then injected into the dorsal lymph sacs of a series of frogs, with the results given in Table VIII

TABLE VIII—*Mushroom Poisoning* (*Muscarine*)
(*Detoxication by Emulsions*)

Frog	Inoculum	Volume Injected	Original Toxic Content of Fluid Injected	Result
		c cm	mg	
1	After treatment with an emulsion containing kaolin No 4 and liquid paraffin	0 5	6	No effect
2		0 8	10	"
3	After treatment with simple emulsion of liquid paraffin	0 5	5 5	Prostate in 15 mins Dead in less than 2 hours
4		0 8	9	
5		1 2	13	"
6	Control solution	0 25	3	
7		0 25	3	
8		0 40	5	
9		0 40	5	

It is evident that a simple emulsion of liquid paraffin has no detoxicating effect on solutions of muscarine, but that paraffin emulsions containing kaolin No 4 in the watery phase detoxicate such solutions vigorously

A final observation was made with histamine, 5 c cm of 0 05 per cent histamine phosphate in aqueous solution was added to 10 c cm of each of the two test emulsions The emulsion was shaken and mixed, and then broken up by centrifuging, the recovered watery element was tested for histamine by the diazo reaction against controls of the original solution proportionately diluted There was no sensible reduction in the intensity of the reaction in the fluid recovered from the simple paraffin emulsion, but the reaction was completely negative in that recovered from the kaolin paraffin emulsion This putrefactive amine was clearly not removed by the paraffin, but was completely taken out of the solution by the paraffin emulsion containing kaolin No 4

Summary

1 A basis has been suggested for the more precise definition of medicinal kaolin

2 It has been shown that, although the usual material sold as kaolin *B P* conforms to official standards, it is still grossly contaminated with sharp grits undesirable in a medicine designed for internal use

3 Attention has been drawn to the sticky flocculated condition assumed by many kaolins when suspended in water

4 Many of the failures of indiscriminate kaolin therapy can be explained as due to the use of unsuitable preparations—namely (*a*) those containing abrasive gritty contaminants, and (*b*) those which tend to coalesce into sticky masses because they contain uncompensated electrolytes

5 The range of the adsorptive affinities of kaolin for dyes and alkaloids has been investigated quantitatively

6 The impossibility of deducing the therapeutic potency of an adsorbent from an estimation of its ability to adsorb some arbitrarily chosen dye has been demonstrated The importance of measuring its power of adsorbing specific toxic materials of clinical significance has been stressed

7 Kaolin is used extensively in the treatment of food poisoning The adsorption of a series of known food poisons has therefore been investigated

8 It is recommended that the therapeutic efficiency of kaolins and allied substances shall not be assayed in terms of methylene-blue, Congo red, or any other dye, but in terms of some definite food poison or decomposition product

9 Quantitative data have been given concerning the adsorptive potency of kaolin in the presence of liquid paraffin

A M Meerloo (*Nederl Tijdschr Geneesk* February 13 1937, p 668) records three illustrative cases of chronic intoxication by hypnotics such as luminal and veronal and the toxic psychosis which may ensue Special emphasis is laid on barbitone toxicomania and the danger of the sudden development of intolerance in cases of prolonged ingestion of the barbitones *Treatment* consists in washing out the stomach injection of coramine and strychnine, venesection and lumbar or cisternal puncture Somatic treatment must always be followed by psychotherapy

It is obvious that further investigation of treatment is necessary I suggest that surgeons should be invited to join groups, each group setting itself to undertake a particular form of treatment, the lines of which should be rigidly specified Members of each group would come from different parts of the country For three years each group would continue on its own lines change of treatment occurring only if its particular line proved hopeless, and only after consultation with the other groups At the end of three years the respective results should be analysed and discussed

THREE SEPARATE CAUSES OF ANTE-PARTUM HAEMORRHAGE OCCURRING SIMULTANEOUSLY*

BY

PHILIP J GANNER, M.B., B.S., F.R.C.S

Honorary Obstetric Surgeon Birmingham Maternity Hospital, Tutor in Obstetrics and Gynaecology University of Birmingham

(WITH SPECIAL PLATE)

This case is of interest as showing three different causes of ante partum haemorrhage occurring together

The patient was aged 40, she was a nine para, the previous confinements and puerperia having been normal There was no history of pregnancy toxaemia She was admitted as an emergency case to the Birmingham Maternity Hospital on April 29 1936, at the twenty eighth week of her ninth pregnancy, during which she had been much troubled by vomiting from the end of the third month onwards, as a result of which she had lost a good deal of weight During the previous four weeks she had noticed gradually increasing swelling of the feet and legs but there had been no headache or visual disturbance She had had several slight irregular losses per vaginam the first of which had occurred at about the sixteenth week Four hours before admission she had had a very severe painless haemorrhage the amount being described by the nurse in attendance as half a bucketful

On admission she was extremely pale and collapsed The pulse was very poor in volume the rate being 142 per minute, there was marked oedema of the whole of the body below the level of the umbilicus The blood pressure was 118/40 The uterus was the size of one of thirty two weeks—that is to say a month larger than that estimated from the menstrual dates It was tense but not tender the foetal parts could not be felt nor the foetal heart heard The urine contained a dense cloud of albumin and large numbers of hyaline and granular casts The loss on admission was only slight

She was given one pint of 10 per cent glucose saline solution and her condition improved sufficiently to allow of vaginal examination being made under gas and oxygen anaesthesia The cervix was found to be three fingers dilated, through it a soft and fleshy mass was protruding Fragments of this were removed and had the naked eye appearance of hydatidiform mole Further violent bleeding occurred and the cervix and vagina were packed She was then given a transfusion of one pint of citrated blood which produced a definite improvement I thought however that her condition was not sufficiently good to stand the further haemorrhage which must inevitably take place during the expulsion of the mole and decided to treat her as a case of severe concealed accidental haemorrhage—namely by abdominal hysterectomy without opening the uterus Her age and parity afforded additional justifications for this line of treatment

Laparotomy under gas and oxygen anaesthesia showed that the uterus was very pale and tense and that both ovaries were enlarged and cystic There was no free blood in the peritoneal cavity Total hysterectomy was performed with practically no loss of blood, one pint of normal saline solution was left in the peritoneal cavity Recovery from the operation was slow owing to her extreme degree of anaemia, the red cell count three days after the operation being only 1,700,000 She was given a second transfusion of half a pint of citrated blood on the fourth day, and from this time improved steadily leaving hospital three weeks after admission

I did not open the uterus until three months after its removal, to allow for adequate hardening to take place When I did so I was surprised to find that a small but apparently normally formed foetus was present, that the placenta, in which vesicular degeneration had taken place was in a position of a central placenta praevia, and that there had been a considerable amount of concealed bleeding between the membranes and the uterine wall Sections of the placenta showed the normal appearance of a hydatidiform mole There was no sign of active proliferation suggesting malignancy Sections from the thinned uterine wall however, showed that there was early penetration of the muscle by the villi, which had not reached the peritoneal coat The naked eye appearances of the specimen are shown in the photograph (Special Plate)

Commentary

This case presents unusual features, in addition to the three coincident causes of ante partum haemorrhage One of these is the occurrence of a vesicular mole in the later stages of pregnancy, another the presence of a well developed foetus in relation to it It is possible that twin foetuses were originally present the vesicular degeneration having taken place in the placenta of one only Finally, the case illustrates the value of hysterectomy in the treatment of severe cases of ante-partum haemorrhage

* Abstract of a paper read at a meeting of the Midland Obstetrical Society, 1936

Clinical Memoranda

A Triple Pregnancy with Extra-uterine Twins

(WITH SPECIAL PLATE)

The following case of an ectopic gestation in the pouch of Douglas and external to the generative organs seems to be worthy of record

CLINICAL NOTES (E. H. R.)

A married woman aged 37 was admitted to hospital on September 7, 1936 She had had two children, the youngest aged 12, but no further pregnancies

She had always been in good health, her periods had been normal, likewise the pregnancies and parturitions She had complained of vague pains since January of that year in the lower abdomen, with amenorrhoea since June 26 For the last three weeks she had been vomiting, there had been flooding and labour-like pains in the lower abdomen

On examination she was found to be blanched and looked very ill She was passing a good deal of blood The temperature was 100° and the pulse 112 There was an irregular mass rising out of the pelvis to the level of two inches above the pubes On vaginal examination a large and rounded mass was felt in the posterior fornix, which was pressing the uterus up in front of it

SUBSEQUENT HISTORY

On September 10 she passed two fragments about one and a half inches in diameter, which proved on microscopical examination to be much degenerated placental masses Eight days later her general condition having improved an examination under general anaesthesia was performed The uterine cavity was found to be four and a half inches long and displaced to the left of the pelvis

The abdomen was opened on October 2 and a tumour the size of a croquet ball was found it filled the right iliac

INFECTIOUS MONONUCLEOSIS (GLANDULAR FEVER) AND MONOCYTIC LEUKAEMIA

BY

M C G ISRAELS, M D, M Sc

Assistant Director in the Department of Clinical Investigations and Research University and Royal Infirmary Manchester

[WITH SPECIAL PLATE]

It has been recognized for some years that the differential diagnosis between infectious mononucleosis and lymphatic leukaemia may be difficult (Sprunt and Evans 1920, Downey and McKinlay, 1923, Baldridge, Rohner, and Hansmann, 1926) The possibility of confusion with monocytic leukaemia has received less attention probably because of the relative rarity of this type of leukaemia The comparison is instructive from two points of view (1) the differential diagnosis is important since the patient always recovers from infectious mononucleosis, whereas monocytic leukaemia is equally fatal, (2) it assists in deciding the nature of the mononuclear cells in infectious mononucleosis

The distinction of a separate type of monocytic leukaemia is now agreed upon by most authorities Several cases have been recorded in America (Dameshek, 1930, Doan and Wiseman; Forkner and Levine, 1934), but in this country reliable reports have been rare (Gittins and Hawksley, 1933, Orr 1933 and Whitby and Christie, 1935) it is therefore proposed to describe a case of monocytic leukaemia recently under observation and to contrast its clinical and haematological features with those of two notably dissimilar cases of infectious mononucleosis

Case I —Acute Monocytic Leukaemia

A housewife aged 53 was admitted to the Manchester Royal Infirmary on April 14 1936 Four months previously she had noticed that she was short of breath on exertion and felt unduly tired These symptoms had become worse and it had been noticed that she was losing weight and becoming paler the dyspnoea was sometimes accompanied by a feeling of constriction round the chest There was no pain of any sort but discomfort after food which had been present for many years was worse Her appetite was poor and she complained of an unpleasant taste in her mouth The bowels were constipated but micturition was normal The menopause had taken place five years before No haemorrhages had occurred and no swellings had been noticed There was nothing of importance in the previous medical and family histories

Clinical Examination—The patient was seen to be very pale and thin The tongue was furred and dry and the teeth were carious There was marked halitosis but no ulceration of the gums tonsils or the mucous membranes of the mouth and throat they were merely congested The temperature was 101 F and the pulse regular its rate being 112 The spleen was not palpable and the liver not enlarged Some signs of consolidation were present at the bases of both lungs The heart and central nervous system presented no unexpected signs The urine contained a trace of albumin The blood count showed red cells 1 090 000 per c mm haemoglobin 30 per cent, colour index 1 36 white cells 14 000 per c mm polymorphonuclears 0 25 per cent lymphocytes 2 75 per cent monocytes 49 75 per cent eosinophils and basophils absent immature monocytes and monoblasts 47 25 per cent and nucleated red cells 1 per 400 white blood cells

The monocytes (Figs 1 2 and 3 on Special Plate) were (1) typical cells with convoluted nuclei and grey blue cytoplasm containing a few azurophil granules and (2) cells with very lobulated nuclei often of bizarre shapes these cells superficially looked like polymorphonuclears but their cytoplasm was typically grey blue with only a few azurophil granules and most of them were oxidase negative About 50 per cent of the monocytes were of this latter type which have been described and named blood histiocytes by Levine (1934) The monoblasts were large and resembled myeloblasts but there was usually more cytoplasm There were many forms transitional between the typical blasts and the mature monocytes these have been classified as immature monocytes The oxidase stain showed a few granules in the typical monocytes and some of the lobulated monocytes but the blasts and immature monocytes were negative

The patient was treated with intramuscular liver extract but this had no effect The anaemia the white cells and the proportion of monocytes steadily increased as shown in Table I The increase of the white cells was chiefly due

TABLE I —*Blood Counts of Case I*

Days	0	4	7	10
Red cells 10⁶ per c mm	1 090	1 080	1 030	0 890

Immature monocytes and monoblasts per cent	47 25	41 25	26 25	11 25
Nucleated red cells per 400 W B C	1	2	1	nil

to the appearance of large numbers of the lobulated monocytes There was some vomiting the patient gradually weakened and died ten days after admission No ulceration of the mouth or throat developed

Post mortem Examination (Dr J Dawson)—The femoral bone marrow was hyperplastic pinkish brown in colour with haemorrhages in parts The heart was of the normal size but there were marked purpuric haemorrhages on the anterior surface of the ventricles the myocardium was pale and showed tabby cat striation on the columnae carneae In the right lung the upper lobe was consolidated and showed the appearance of grey hepatization the lower lobe was congested and oedematous The left lung showed some oedema and congestion with pus in the bronchi of the lower lobe the upper lobe was healthy The liver (1 200 grammes) was pale and fairly firm there was marked mottling due to passive congestion and free iron was abundant The spleen (100 grammes) was of normal size consistency and colour on section it showed a purplish mottling on a light brown ground and the iron reaction was marked The other organs showed no noteworthy abnormalities

Microscopical Examination—The bone marrow was not very hyperplastic, fat spaces were present everywhere with small cellular patches and patches of haemorrhage between them The cells were chiefly (1) monocytes with very lobulated nuclei (2) cells with much larger vesicular nuclei with two or three lobes—large monocytes and (3) cells with non lobulated vesicular nuclei and a fair amount of pale blue cytoplasm—immature monocytes and monoblasts Eosinophil myelocytes were seen occasionally and a neutrophil or eosinophil polymorphonuclear rarely Lymphocytes were present in small numbers No megakaryocytes and hardly any nucleated red cells were seen

In the spleen the Malpighian bodies were hardly visible The pulp was very cellular monocytes with lobulated nuclei were numerous and blast cells were also common there was usually one myelocyte or polymorphonuclear cell—neutrophil or eosinophil—in each oil immersion field The reticulum cells with elongated nuclei and clearly defined processes were unusually prominent

thirds of the pelvis lying behind and completely adherent to the broad ligament It was also adherent to the wall of the pelvis It shelled out until the only connexion was with the ovary, whence it derived its blood supply It was removed and the ovary sutured there was no connexion between the tumour and the right tube The patient made an uneventful recovery

PATHOLOGICAL REPORT (A G S)

The tumour submitted for examination (see Special Plate) was oval it measured four inches by three and three quarter inches and had a vertical depth of two and a half inches A foetus corresponding in size to that of a three months gestation was found quite external to the tumour but attached thereto by the umbilical cord

On opening the tumour a second foetus of the same size was found The two were attached to a common placenta The amnion was clearly defined in the second foetus The rest of the tumour was firm and fibrous it contained many haemorrhages and was laminated The original scrapings from the third individual showed obvious placental tissue with syncytial cells and vacuolated foci

COMMENTARY

The interest lies in the presence of an intra uterine pregnancy which had aborted, as shown by the placenta passed per vaginam, the size of the uterine cavity, and a twin extra uterine pregnancy attached to and arising from the ovary

Colloid Goitre Requiring Tracheotomy

A review of the literature of cases of colloid goitre shows that the onset in these cases of acute tracheal obstruction requiring tracheotomy or thyroidectomy is a rare occurrence C A Joll (1932) in a review of 2 000 cases of thyroid disease had only three cases of acute respiratory obstruction Berry states that these cases are supposed to be more common in males than in females, and usually occur between the ages of 12 and 20 Of Joll's three cases two were male and one female and he stated that partial thyroidectomy was preferable to tracheotomy unless the special Konig's tracheotomy tube was available Further cases have been recorded by G R Girdlestone (1921) one case W Capelle (1935) three cases, D S Mitchell and R R Struthers (1933) one case of tracheotomy at the age of 2½ months for congenital hypertrophy of the thyroid, P Guibal (1932) one case

The cause of the obstruction is suggested by Croty to be due to hypertrophy of the pretracheal muscles, and by Rose (1878) to be due to softening of the tracheal rings The present case was a boy aged 13 who was admitted as an emergency with acute tracheal obstruction

CASE RECORD

The boy had complained of a swelling in the neck for about six months and occasional attacks of bronchitis and asthma He had been ill for two days before admission with a cough He lived in Halifax where drinking water was supplied direct by the borough On admission the child was unconscious and a tracheotomy was performed in the receiving ward A catheter was passed down the trachea to below the thyroid isthmus The case was then transferred to the theatre and the isthmus was divided under local anaesthesia After the operation the pulse rate was 136 and the temperature 101 F There was a gradual improvement for the next fourteen days when the temperature returned to normal and the pulse rate to 86 The boy was very pale but the blood count was haemoglobin 100 per cent red cells 5 630 000 colour index 0 9 leucocytes 8 300 Repeated attempts to leave out the tube failed A well marked thyroid tumour was present the right lobe being larger than the left

On July 19 1935 bronchoscopy revealed softening of the tracheal rings from pressure of the enlarged thyroid There was persistent tachycardia and the child was very pale but examination of the heart revealed no organic lesion

On August 1 under avertin intratracheal ether and oxygen anaesthesia four fifths of the right lobe of the gland were resected The general condition was not very good but gradually improved Repeated attempts to remove the tube still failed and at night while asleep the breathing was very noisy and stertorous *Stridor was present as soon as the tube* was removed and it was thought that the pressure of the thyroid had so softened and deformed the trachea that it collapsed when the tube was removed General treatment with cod liver oil ultra violet light and calcium lactate 6 grains three times a day was instituted

The pathological report showed the specimen to be a colloid goitre and on September 30 the blood calcium was 11 8 *grammes per 100 c cm* The patient was discharged on October 30 with a rubber tracheotomy tube He was seen at intervals afterwards and the general condition became much improved

On January 2 1936 the tube came out at home and could not be reinserted but as the child appeared comfortable without it no attempt was made at replacement He was brought to hospital and kept under observation for five days but there was no return of the symptoms

On examination as an out patient on November 5 1936 the general condition was good and the weight 6 st 7 lb He could play football and no longer snored at nights The scar showed a little tendency to keloid formation and the left lobe of the thyroid though palpable was considerably smaller than it had been on discharge from hospital ten months previously

COMMENTARY

On admission the boy was unconscious and a high tracheotomy was performed and the obstruction relieved by the passage of a piece of gum elastic catheter Simple division of the isthmus of the thyroid was not successful in relieving the obstruction bronchoscopy suggested that this was due to collapse of the tracheal rings and even partial thyroidectomy at a later date would not allow of immediate removal of the tracheotomy tube It was apparently necessary for considerable time to elapse before the trachea regained its normal rigidity In none of the recorded cases of a colloid goitre causing tracheal obstruction was the goitre more than moderately enlarged This is surprising in view of an article on experimental surgery by E Walter Workman and G Gavin Miller (1935), in which they made the interesting observation that a colloid phase of the thyroid could be produced in guinea pigs by an experimentally induced tracheo stenosis If these observations are applicable to man it is surprising that cases of marked tracheal obstruction are not more common because a small degree of tracheo stenosis should tend to increase the size of the thyroid goitre thereby initiating a vicious circle

* Turck cells

In the liver some fatty changes were present in the cells at the centres of the lobules No definite leukaemic infiltration was manifest, though the blood vessels could be seen to contain lobulated monocytes

Case II—Infectious Mononucleosis

A female shop assistant aged 21 was admitted on account of haemorrhage from the rectum The history was that from the time of the onset of menstruation at the age of 14 she had bruised easily, bleeding from cuts had been unusually free, and dental extraction had also been complicated by haemorrhage Menstruation was irregular, and there was usually considerable loss She had always been pale, but during the last few weeks her pallor had become noticeably intensified Fourteen days before admission there had been a quite considerable haemorrhage from the rectum after defaecation, she had felt unusually tired, and had been obliged to stop work and go to bed a week later Some haemorrhagic spots had appeared on the lips, which had bled a little, but there had been no further haemorrhage from the rectum or elsewhere, and no rash No dyspnoea or palpitation was noted but her appetite had been poor The bowels were constipated but micturition was normal There had been slight loss of weight For the last week she had felt unusually languid, and there had been much sweating The previous medical history included rheumatic fever and scarlet fever at the age of 7

Clinical Examination—The patient appeared thin but not wasted, pale, and white There were numerous small haemorrhages on the lips, but the tongue was clean and the teeth were good The tonsils were congested but only slightly enlarged and the throat was slightly congested The skin was pale and damp, no rash was seen The pulse was regular and of good volume, its rate being 96 the temperature was 101° F The spleen was not palpable and the liver not enlarged No enlarged lymph glands were found The heart was not enlarged, but there was an apical systolic murmur the blood pressure was 110/70 mm Nothing abnormal was found on examination of the lungs and the central nervous system, the urine was free from pathological constituents The blood count showed red cells 4 130,000 per c mm haemoglobin, 53 per cent, colour index, 0 65, white cells 8 200 per c mm polymorphonuclears 34 25 per cent lymphocytes 30 75 per cent monocytes, 6 75 per cent, eosinophils 0 25 per cent basophils, 0 5 per cent, myelocytes 0 5 per cent abnormal mononuclears, 27 per cent, nucleated red cells absent, platelets, 494,000 per c mm The abnormal mononuclears were of two types (Figs 4 and 5 on Special Plate) (1) large cells with a large nucleus either round or bean shaped with a stippled chromatin pattern the cytoplasm being dark blue and ranging in amount from fairly abundant to scanty, and (2) cells equally large, with round nuclei whose chromatin had a less well marked pattern and whose cytoplasm was pale grey-blue with a few azure granules and vacuoles The first type looked like exaggerated Türck cells, the second type resembled exactly the immature monocytes seen in Case I About 60 per cent of the abnormal mononuclears were of this second type There were cells which it was difficult to place in either type and, in consequence, all were classified together as 'abnormal mononuclears"

The Wassermann reaction was negative The van den Bergh test showed 0 3 unit of bilirubin Cultures from a throat swab showed that no diphtheria was present, haemolytic streptococci and *Staphylococcus albus* were found

Treatment with pil ferri 90 grains daily was commenced at once On the fourth day after admission the patient complained of sore throat, and there was some swelling of the cervical and axillary lymph glands and of the tonsils, the temperature was now normal The blood count (see Table II) showed that the white cells had risen to 21,200 per c mm, with 32 75 per cent of abnormal mononuclears By the eighth day her condition was much worse The temperature was 101° F, the tonsils were very swollen, especially the left, which showed excavation on the surface and exudation The lymph glands all over the body were enlarged The blood count was much as before From this day, however, recovery set in, and ten days later the swelling of the tonsils had almost completely subsided The lymph glands were no longer enlarged and the temperature was normal, the white cell count had fallen below 10,000 per c mm and there was only a small percentage of abnormal mononuclears The Paul Bunnell test (1932) at this time gave a result (positive in a dilution of 1 in 16) which was compatible with an infectious mononucleosis that had passed the acute stage, Twenty three days after admission she was discharged to the department's out-patient clinic, treatment with iron being continued During her time in the ward there had been no rectal haemorrhage or other bleeding, except from the lips, and this had now ceased She continued to recover, and the blood returned towards normal levels

Case III—Infectious Mononucleosis

A glass bender aged 24 was admitted with the history that fourteen days previously he had noticed some swellings in the neck and under the left jaw, those under the jaw were tender He felt tired, but continued at work One week later he had a severe attack of griping pain in the left hypochondrium, and at the same time he complained of sore throat and dysphagia No haemorrhages occurred there was no rash and she had no cough The bowels were constipated and micturition was normal Since both these symptoms became worse he obtained medical advice A blood examination showed that there were 19 200 white cells per c mm, of which 92 per cent were reported as lymphocytes

Clinical Examination—On admission to the Infirmary he had a good colour and was rather flushed and well nourished,

Reviews

THE ST THOMAS'S REPORTS

St Thomas's Hospital Reports Second Series Vol 1 Edited by O L V S De Wesselow and C Max Page 10s London St Thomas's Hospital 1936

In a short introduction to the first volume of a new series of these reports Mr Max Page points out that St Thomas's was the first of the English hospitals to bring out a publication of papers, clinical lectures, and case notes, recorded by students or the editor with comments by the responsible member of the staff The first number of the original series appeared in November, 1835, but publication ceased after 1836 until a second series appeared in 1870 This contained articles by members of the staff and medical school and also introduced statistical tables This series has appeared regularly since, but latterly has consisted mainly of arid statistical tables Those responsible for the issue of the Reports have had a growing feeling that the disinterested records of bulk figures in relation to hospital work have nowadays little value, at any rate unless they are associated with instructive observations from organized follow-up departments It has therefore been decided to discontinue the statistical element, and in its place publish an annual volume which will aim, in a series of original articles, at a reflection of recent work carried out in the hospital The number before us represents the first attempt to fulfil this scheme

The contributions to the present volume may be grouped under various headings Of the didactic articles Professor McSwiney contributes one on present-day views of the constitution and function of the involuntary nervous system, and Dr A J Wrigley another on the physiology of menstruation Here students of the subject will find a very clear and useful guide to the rather intricate interrelations of pituitary and ovarian hormones, and further, the indications for the use of endocrine therapy in the various upsets and syndromes of disordered menstrual functions are well set out Among the diagnostic articles Professor Dudgeon points out that perfect specimens of particles of malignant growth may be obtained by a careful technique from the sputum of cases of suspected malignant growth of the lung or respiratory tract In forty-three cases of malignant growth of lung particles of growth were found in the sputum, and the histological features of the malignant cells were comparable with those of specimens obtained at biopsy or necropsy In an interesting account of modern methods in the diagnosis of plumbism Mr Lowndes points out that the occurrence of some amount of lead in the body is the rule rather than the exception, and that care must therefore be exercised in the diagnosis of lead poisoning In cases of suspected plumbism examination of the blood is more satisfactory than estimation of excreted lead The blood lead is normally fairly constant and abnormal quantities are easily detected In his experiences of the Friedman test for pregnancy Dr Bamforth found it rare for a diagnosis of a positive result to be incorrect If a negative result is obtained the test should be repeated in a week with a fresh specimen of urine In no case where the first test was negative and the second test positive has the "positive" been shown to be wrong and the repetition has prevented a number of false negative results The Friedman test may also be of considerable value in the differential diagnosis of tumours of the testicle, since a large proportion of cases of teratoma of the testicle give a positive reaction

The more clinical papers include studies of metastatic brain tumours by Dr Elkington, diabetic coma by Dr Card, the treatment of pituitary basophilism by x rays and of prostatic obstruction by transurethral resection A very satisfactory summary of the operative treatment of Ménière's disease is given by Mr Mill, and two orthopaedic papers on the treatment of adolescent coxa vara and of non-union of the carpal scaphoid are useful In cases of inoperable carcinoma of the rectum a follow up of 123 cases showed that colostomy alone in the absence of acute obstruction carried an operative mortality of 17 per cent and did not materially increase the expectation of life, it should be performed only when strictly indicated, and a proportion of cases can be kept comfortable for a long time by other means At the other end of life the care of the premature infant is usefully discussed by Dr Doyne Bell, who emphasizes the need for maintaining from the moment of birth the normal body temperature by artificial means with the minimum of handling and disturbances, and the superiority of breast milk over other methods of feeding

A study of a more philosophic nature by Professor De Wesselow and Dr Griffiths deals with the pathology of diabetes Earlier work had led to the enunciation of two opposite theories that in the diabetic state sugar might be produced in the body in excess of its current requirements, or that the tissues might be unable to utilize a normal supply of sugar The discovery of insulin and of its beneficial action in diabetes led to a swing to the latter theory of causation There are, however so called diabetogenic factors in the pituitary gland which are capable of disturbing the normal regulation of carbohydrate metabolism In any group of patients attending a diabetic clinic there are cases in which the possible role of the pituitary cannot be ignored—those past middle age and obese, whose glycosuria and hyperglycaemia is accompanied by little ketonuria and appears to affect very little the patients' general well-being or to shorten appreciably their expectation of life even in the absence of strict treatment with diet and insulin Plasma from these patients is found to produce an early arrest of the fall of blood sugar of rabbits after injection of insulin in a manner closely resembling the results of other workers after injection of extracts of the anterior pituitary gland No such effect followed injection of the plasma of young diabetic patients and of normal controls The authors suggest that the explanation of the diversity of symptoms and course of these two groups of diabetic patients may lie in a difference of aetiology

This volume, then is interesting and instructive and will appeal not only to old St Thomas's men but to other workers in similar fields

VENEREAL DISEASES

Practical Methods in the Diagnosis and Treatment of Venereal Diseases By David Lees DSO MA MB DPH, FRCSEd FRCPEd Third edition edited and revised by Robert Lees MB FRCPEd (Pp 608, illustrated 15s net) Edinburgh E and S Livingstone 1937

Owing to the death of David Lees the third edition of this work has been edited and revised by Dr Robert Lees with the help of several contributors The book has remained about the same size, syphilis of the nervous and cardiovascular systems has been rewritten the chapter on chancroid phagedaena, inguinal bubo etc is all new material, and that on vulvo vaginitis has been largely rewritten Two appendixes have been added one containing a list of the commoner drugs used in syphilis and the other a list of clinics for the treatment of venereal

he found it painful to speak or to swallow The tongue was furred and dry the teeth were good and the tonsils were red but not enlarged or ulcerated the throat was injected and oedematous but no ulcerations were present The temperature was 101 F the pulse regular rate 95 All the groups of lymph glands in the neck were enlarged and the glands were discrete movable, and about 2 cm across there was a larger mass in the left submaxillary region which was tender but not fluctuant The occipital and parotid glands were enlarged a few glands were palpable in the axillae and one large gland was present in each inguinal region There was some tenderness in the left hypochondrium the spleen was not palpable and the liver not enlarged Examination of other systems revealed nothing of note The blood count showed red cells 4 890 000 per c mm haemoglobin 94 per cent colour index 0 96 white cells 16 800 per c mm polymorphonuclears 13 5 per cent lymphocytes 64 per cent monocytes 6 per cent eosinophils and basophils absent abnormal mononuclears 16 5 per cent nucleated red cells absent The abnormal mononuclears were mostly of the type with large nuclei and dark blue cytoplasm The Wassermann reaction was negative the Widal reaction was negative for all standard antigens the Paul Bunnell test was positive in a

dilution of 1 in 128 (which the authors regard as almost certainly diagnostic of infectious mononucleosis)

From the time of his admission the patient steadily improved the glands became less swollen and tender the throat less painful and the blood counts showed a return to a more normal picture He was discharged after twelve days feeling quite well, although the blood count, as usual, still showed some mononucleosis

Discussion

The three cases described seem to form examples of a graduated series, Case I being typical of monocytic leukaemia, Case III characteristic of glandular fever, while Case II shows features of both Case II presented unusual features haemorrhage of any sort is rare in infectious mononucleosis, and Tidy (1934) states that he has only been able to trace one case where there was haemorrhage from the rectum The white cell count reached a high level, nearly to Tidy's maximum of 40,000 per c mm

Differential Diagnosis

In characteristic cases such as exemplified by Cases I and III, the differential diagnosis presents little difficulty The patient with acute leukaemia is severely ill, there is marked anaemia, and a high proportion of the leucocytes are recognizably immature The patient with glandular fever has an illness which is clinically mild, there is no anaemia of any significance, and although there is a mononucleosis only a small proportion of the cells can be interpreted as immature

In less typical cases the diagnosis may present great difficulty Both conditions may show pyrexia, enlarged lymph glands and an enlarged spleen Mouth lesions and sore throat not part of a leukaemic syndrome, may be accompanied by a mononucleosis (Friedmann and Elkeles, 1928, Hartfall, 1934) Case II shows that haemorrhage and anaemia may occur in infectious mononucleosis as well as in leukaemia but the anaemia of acute leukaemia, except in the early stages, is usually more severe than in Case II The total white cell count is no guide the majority of cases of acute leukaemia have white cell counts under 40,000 per c mm and many are under 10,000 per c mm (Israels 1936) The morphology of the mononuclears is however, usually very helpful, and this together with the clinical impression of the illness, are the most useful points The recent heterophil antibody tests introduced by Paul and Bunnell (1932 and 1933) also seem to be promising

Morphology of the Mononuclears

Longcope (1922) describing infectious mononucleosis wrote that the mononuclears were of three types normal lymphocytes large cells identical with the large mononuclears and transitional cells of normal blood and mononuclears of a type not encountered in normal blood Further experience of the disease has confirmed the accuracy of this classification and although all three varieties are increased in number in infectious mononucleosis, attention has been particularly directed to the abnormal mononuclears since they give a valuable diagnostic clue As stated previously (Case II) there are two chief varieties (1) large cells with large round or bean shaped nuclei and scanty to fairly abundant dark blue cytoplasm and (2) equally large cells with large round nuclei with pale grey blue cytoplasm Transitional forms between these two occur American writers (Sprunt and Evans, 1920 Longcope, 1922 Downey and McKinlay 1923, and Baldridge *et al*, 1926) have usually interpreted them all as lymphocytes, Wiseman (1936) regards infectious mononucleosis as an infective hyperplastic lymphatic condition certain German authors (Baader 1922 Hopmann, 1923) regard them as monocytes More recently in this country Whitby and Britton (1935) think that they are all monocytes while Tidy (1934) is of opinion that both lymphoid and reticulo endothelial tissues are involved On the whole it seems likely, however, that both abnormal lymphocytes and immature monocytes occur In the figures of Downey and McKinlay (1923) and of Baldridge Rohnei, and Hansmann (1926) there are cells which to day would almost certainly be interpreted as immature monocytes, though at the time when these papers were written the conception of monocytic leukaemia, with the knowledge it gave of the characters of immature monocytes was not widely known The finding in Cases I and II of this series of very similar if not identical cells corresponding to the second type of abnormal mononuclears mentioned above also suggests that these are immature monocytes With regard to the first type of abnormal mononuclears there seems to be no means of deciding definitely whether they are lymphoid or monocytoid supravital staining, as Tidy (1934) and Hall (1930) have pointed out gives no more evidence than other methods They are different from the monoblasts as seen in Case I and from myeloblasts being usually larger and with a greater quantity of darker-staining cytoplasm and a different nuclear pattern Downey (1923) gives reasons for regarding them as lymphoid

In making the counts no attempt has been made to classify these cells because as Baldridge puts it any attempt at dividing the cells into groups leads to stilted classifications based on slight morphological differences and varying with different observers and also because

disease for reference in hospital and dispensary practice

Students and general practitioners will find all that they need in this admirable little book which contains a wealth of information in a comparatively small compass The names of the authors and their wide experience of the subjects with which they deal are sufficient guarantee of the accuracy of the contents of a book which has been brought up to date Methods of treatment and diagnosis are constantly changing so that a new edition is to be welcomed and this one is a marked improvement on its two predecessors Many of the figures are beautifully produced but others are not so good notably those showing gonococci and allied organisms on pp 326–7 The value of vaccines in suitable cases is stressed and no doubt rightly it would seem that the pendulum has of recent years swung too far for many have almost given up using them Quite rightly, too the treatment of syphilis has been brought into line with that recommended by the League of Nations Health Committee, the conclusions of this body carry so much weight that he would be a bold man who questioned them

Malpharsen and short-wave therapy find no place in this book except that the former appears in the appendix, it may be that both have a future before them Errors are few but primipara (p 117) is not a plural word, and most of us when taking blood from a vein apply the thumb *distal* and not *proximal* to the point where we intend to puncture it nor do most cricketers swing the arm round and round in throwing a cricket ball (p 45) Expressions such as male gonorrhoea and internal viscera are better avoided

DEFENCE AGAINST AIR ATTACK

The Protection of the Public from Aerial Attack A Critical Examination of the Recommendations put forward by the Air Raid Precautions Department of the Home Office By the Cambridge Scientists Anti War Group (Pp 127 2s 6d net) London Victor Gollancz 1937

This short volume embodies a critical examination of the recommendations issued by the Air Raid Precautions Department Members of the Cambridge Scientists Anti-War Group have made experiments on three points—namely the extent to which it is possible to make an ordinary room gas proof the practicability of the methods recommended for dealing with thermite bombs and the efficacy of gas masks The value of the last mentioned inquiry is made somewhat doubtful by the statement of Dr H Dolence Woodruffe county director of the Oxford shire branch of the British Red Cross who, speaking at Oxford last month stated that the container investigated was only a training pattern and that the container to be issued at the outbreak of war to civilians as well as troops will be much superior It seems wisest to leave Oxford and Cambridge to discuss this matter The Cambridge group has proved that an ordinary wall of brick and plaster has surprisingly little power to check the diffusion of a true gas On the other hand, it must be remembered that the most deadly "war gases are not gases but either mists or dusts and to these a brick and plaster wall would probably offer a fairly effective resistance

We are inclined to doubt whether this book performs any public service The authors comment on the way in which the air raid precautions officials stress the danger of panic and ask why should they fear panic so much? The answer seems fairly obvious An air attack on a big city is certain to be as nasty a business as anyone can imagine Professor Lindemann who speaks with authority on such matters, has suggested lately in the *Morning Post* that the probable casualty list from a single big raid would be 10 000 killed and 40 000 wounded It is however certain that the casualties will be increased tenfold if the population dashes about the streets in mobs under the influence of panic, because even if houses cannot be made gas proof yet people will be far safer inside a house than outside On the other hand it must be admitted that the eye wash in Government publications provides a good deal of excuse for the reactions exhibited in this book Reading the official publications makes one realize the unchanging nature of official minds in particular with regard to their leading tenet that the public must never be frightened by being told unpleasant truths

GROWTH OF MEDICINE SINCE THE MID-SIXTEENTH CENTURY

The Development of Modern Medicine An Interpretation of the Social and Scientific Factors Involved By Richard Harrison Shryock (Pp 442 illustrated 18s net) Philadelphia University of Pennsylvania Press London H Milford Oxford University Press 1936

Dr Shryock is professor of history in the Duke University, and his volume on the development of modern medicine is both complete and well written He gives chapter and verse in footnotes for each statement and the book is valuable therefore as a work of reference for those who wish to pursue further any special line of investigation It ranges from the middle of the sixteenth century to the present day Professor Shryock states that his object has been to portray certain major aspects of medical development against the background of intellectual and social history in general The earlier portions of the book therefore are chiefly philosophical and abstract the later sections are concrete and deal with subjects and developments in which many of the present generation have taken an active part

A handsome tribute is paid to the work of the French physicians at the beginning of the last century especially to Pierre Louis He was the prototype of the modern whole time student of medicine For seven years he did nothing but work in the wards and in the post mortem room, and for three years he never wrote a word about his results A well deserved tribute too is paid to Johannes Muller who was responsible more than anyone else for the introduction of the modern scientific spirit into German medicine and thence into England where it inspired such great teachers as Sir James Paget The story of the public health movement from 1800 to 1880 is well told more especially of the great epidemics of Asiatic cholera in the middle of the century and of the results upon sanitation both in the United States and in Great Britain John Snow's work is mentioned but that of Dr Th H Buckler of Baltimore appears to have escaped notice The growth of bacteriology from the work of Davaine to the time of the viruses is well described and there is a thoughtful final section on Practice in a Changing Society 1880–1930

The book is well worthy of serious consideration and should become a standard work There are eight full page illustrations copied from paintings by various artists In view of future editions it may be noted that as might be expected from our complicated and difficult system of entry to the medical profession Professor Shryock is not always quite accurate in his statements about the Royal Colleges and the licensing bodies He calls Lister a Scottishman which he was not for he was an English Quaker He fails to point out that Captain Cook owed the success of his voyage round the world less to the lime juice he made his crew drink than to his remarkable

these differences are not reflected clinically The proportions of normal lymphocytes, normal monocytes and abnormal mononuclears seem to vary from case to case sometimes the monocytoid cells are prominent sometimes the lymphoid cells But it may be said that if the clinical picture is suggestive the presence of a mononucleosis which includes a significant proportion of the abnormal mononuclears described makes it very likely that the condition is infectious mononucleosis

Apart from causing diagnostic difficulties it is of great interest that immature monocytes should appear in an apparently infective state as well as in a leukaemic state It is well known that in septicaemia myelocytes may appear in the blood and that whooping cough often causes a lymphocytosis of leukaemic proportions It is possible that the relation between the monocytosis of monocytic leukaemia and glandular fever may be similar, thus bringing the monocytic series into line with the other series of leucocytes At present there is no evidence as to the nature of the relation between this type of response and that of leukaemia

Summary

1 A case of monocytic leukaemia and two cases of infectious mononucleosis (glandular fever) presenting different clinical and haematological characters are described

2 In infectious mononucleosis mononuclear cells of types not found in normal blood appear These cells are described and it is suggested (by comparison with the cells in monocytic leukaemia) that some of them are immature monocytes and that others are probably lymphoid These cells are very typical and are of considerable value in diagnosing the condition

3 The differential diagnosis between monocytic leukaemia and infectious mononucleosis is considered

I am glad to acknowledge assistance I have received from Dr J F Wilkinson and other members of the honorary staff of the Manchester Royal Infirmary who have allowed me access to cases under their care, from Professor Dougal for the loan of apparatus, and from the Lady Tata Memorial Trust Fund

The tenth congress of oto neuro ophthalmology will be held at Geneva under the presidency of Professor F Naville from May 14 to 16 when papers will be read on the central vestibular tracts and their disorders by Professor Van Gehuchten of Louvain and on topographical syndromes of these tracts by Professor J A Barre of Strasburg Further information can be obtained from M Edmond Barbey, 20, Rue du General Dufour, Geneva

TERMINAL CASEATING TUBERCULOUS BRONCHOPNEUMONIA

IN WHICH THE DATE OF ONSET WAS KNOWN

BY

C E H TURNER, M R C S, L.R C P

Assistant Medical Officer South Yorkshire Mental Hospital, Late Assistant Bernhard Baron Institute of Pathology London Hospital

(WITH SPECIAL PLATE)

In any subacute or chronic tuberculous lesion found at necropsy data are rarely available for fixing the time at which the pathological process began As a rule this can only be inferred from the time at which signs or symptoms were first noticed By how long the pathological changes had preceded these it is usually impossible to say In the case which is here recorded it so happened that data were present for fixing within narrow limits the time of onset and consequently the rate of development of gross tuberculous lesions in the lungs

Pathological Evidence

On August 20, 1936 a necropsy was made on a man, 45 years old, who had been a patient of the South Yorkshire Mental Hospital for nine years The body was extremely emaciated A large area of tuberculous bronchopneumonia was found occupying the upper and middle zones of the left lung and there was a rather smaller area in the right lung in the same parts (see Special Plate, Figs 1 and 2)

The presence of such gross and extensive lesions in the lungs came as a surprise, because although tuberculosis had been suspected in this man for some years owing to his progressive wasting yet at no time had any abnormal physical signs been found in the chest Even as recently as July 2 1936—that is, less than two months before death —not only had no abnormal physical signs been found on careful examination, but also an x-ray film of the chest had shown nothing definitely abnormal (Fig 3) One must therefore suppose either that almost the whole of this extensive invasion of the two lungs had developed since July 2, 1936, or that there were at that date marked tuberculous changes in the lungs which not only gave rise to no obvious physical signs even when carefully sought for, but which also showed no evidence of their presence on x ray examination

It would be contrary to all our radiological faith to believe that any gross focus of tuberculosis could have been present in these lungs at the date at which this radiograph (Fig 3) was taken It therefore follows that almost the whole of the areas of solidification and excavation found at the post-mortem examination must have developed during a period of some fifty days or less, how much less it is impossible to say

Mention has already been made of the extreme emaciation of the body at death and of the fact that this loss of flesh had been going on for six years so as to cause repeated suspicion of tuberculosis The explanation of this wasting is found in the records of the case The man was a melancholic, with strong suicidal tendencies and had acquired the habit of regurgitating a considerable part of every meal Nothing could be done to prevent this The wasting was thus due to gradual self starvation, brought about by the psychosis

knowledge of sanitation, for he obtained good water wherever possible, ventilated the lower deck, and made his men change into dry clothes. There are slight misprints on pages 265, 329, and 331. Sir Henry Acland's name is incorrectly spelt on page 232 as well as in the index. Sir James Y. Simpson first used chloroform in 1847, not in 1851 as is implied.

RADIOLOGY OF DUST DISEASES

Rontgenatlas der Staublungenerkrankungen der Ruhrbergleute. By Dr. G. Schulte. (Pp. 141, 153 figures. M. 24; geb., M. 26.) Leipzig: G. Thieme. 1936.

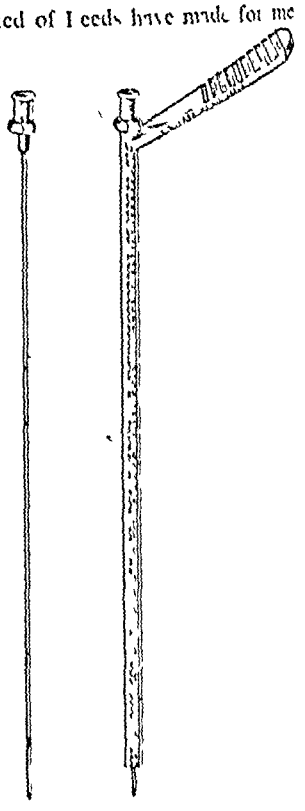
In the last few years the study of silicosis has assumed great importance not only in clinical work in certain districts, but particularly in connexion with workmen's compensation. The diagnosis of the condition still largely rests on the x-ray photograph of the chest, and the tendency of silicosis to favour the development of pulmonary tuberculosis increases the difficulties in the differential diagnosis. The atlas by Schulte will therefore be assured of a hearty welcome. A few pages of succinct notes on the various aspects of dust disease of the lungs are followed by remarkably clear reproductions of chest skiagrams, selected portions of each side being printed in natural size.

The book is divided into three parts. The first consists of photographs of the various degrees of silicosis and silico-tuberculosis. Part II. comprises several series of two to three skiagrams of the same patient taken at intervals of a few months to a few years showing the development of silicosis, its increasing severity or its development into silico-tuberculosis in the same individual. Finally, a few skiagrams are added of conditions which may simulate silicosis. Essential clinical notes are appended to each case, with a brief description of the probable underlying anatomical changes, for these Dr. Hasten is responsible. Attention may be drawn to the one oblique skiagram included in this volume for it disproves a current conception that in the course of silicosis calcification may occur in the hilar glands. The author shows that these mulberry-shaped shadows are really situated in the substance of the lung, and are probably due, he thinks, to silicotic changes around bronchioles and vessels in the region of their branching.

Notes on Books

The 1936 Year Book of General Medicine (Chicago, The Year Book Publishers; London: H. K. Lewis and Co., 12s. 6d.) is a compact little volume divided into five parts, devoted respectively to infectious diseases, by George F. Dick; diseases of the chest (except the heart), by Irwin Brown; diseases of the blood and blood-forming organs and diseases of the kidney by George R. Minot and William B. Castle; diseases of the heart and blood vessels by William D. Stroud; and diseases of the digestive system and of metabolism by George B. Eisterman. In addition to a review of the recent work on the diseases usually sent to isolation hospitals, the section on infectious diseases contains under the heading of 'arthritis' a useful survey of the problem of "rheumatism" and arthritis, including an account of x-ray findings in various types of chronic arthritis, results of blood cultures and the results of fever therapy and other forms of treatment. The section on diseases of the chest besides a description of the literature on the serum therapy of pneumonia contains a full account of recent work on tuberculosis both in its medical and surgical aspects. The text is freely interspersed with photographs, skiagrams, and other illustrations.

From the patient's point of view there is not much scope for humour in the profession of dentistry. In *Doothful Essays* (Bale, Sons and Danielsson. 7s. 6d.) Mr. EDWARD SAMSON successfully combats this view. The book is a humorous survey of dental practice, in which the author directs the shafts of a kindly and discerning wit against himself, his colleagues and his patients. His versatility is remarkable. The essays are admirably illustrated with his own caricatures and the sequence of prose is occasionally broken by amusing parodies in verse. Mr. Samson divides good patients into two types. The first is almost fanatically attached to his dentist, believes all he says, worships his work and spares no pains to send everybody else to the door of such a brilliant man. The second demands the very best work and realizes that this deserves the highest reward which he is only too anxious to make without any reminder. On rare occasions these two types coexist to form the ideal patient. Underlying the humour of this book is a substratum of wisdom and shrewd common sense, but it is primarily a book for amusement. Dentists will derive the greatest enjoyment from reading it, but their patients also will find it diverting.



We have received the bound volumes of the Minutes of the General Medical Council and of its various committees and branch councils for 1936, complete with fourteen appendices (vol. lxxii), also the general index to the minutes of the General Medical Council, the Executive and Dental Executive Committees, and the English, Scottish and Irish branch councils for 1903–36 (vols. xl. to lxxii). Both volumes are published and sold for the General Medical Council by Constable and Co. Ltd., 10, Orange Street, Leicester Square, W.C., and the prices are 12s. and 10s. respectively.

Preparations and Appliances

SYRINGE FOR SPLANCHNIC ANAESTHESIA

Mr. HAROLD UPCOTT (Hull) writes:

Messrs. C. F. Thackray, Limited, of Leeds have made for me an instrument to facilitate the production of splanchnic anaesthesia in operations on the upper abdomen under local infiltration. It consists of a blunt-ended rigid cannula six and a quarter inches long fitted with a flange at one end. This carries a Record needle a quarter of an inch longer than the cannula. When the abdomen is opened a finger of the left hand is passed down to the lateral aspect of the body of the twelfth dorsal vertebra. The cannula, with the needle retracted, is passed along the finger until its blunt end is resting on the posterior abdominal wall. It is held in this position while a syringe is attached to the other end of the needle and pushed home before making the injection. The injection is then repeated on the opposite side.

gical treatment Anomalies of the heart and urinary tract may give rise to symptoms referable to the gastro intestinal tract and must be borne in mind Education of the family is required to correct faulty environment and hygiene Whole milk dilutions with added sugar and vitamins supply proper food to the infant in almost every instance Proprietary foods are rarely required Causes of digestive disturbances in infants are to be looked for in the first three groups rather than in the last group Infants have a wide tolerance in digestive and assimilative capacity, and can adapt themselves to a variety of food combinations provided their fundamental requirements are satisfied

10 BCG Vaccine in Children

C KERESZTURI and W H PARK (*Amer Rev Tubere* October, 1936 p 437) describe their findings after eight years experience of BCG vaccinations of children in America (1) They are able to substantiate Calmette's claim that BCG vaccine is harmless in humans provided they are free from tuberculous infection Before using it on children they administered it to some four hundred animals without producing tuberculosis 175 infants not exposed to tuberculous infection over periods of one month to eight years did not develop tuberculosis after the administration of the vaccine Of 515 children exposed to infection five died of tuberculosis but on necropsy the human and not the bovine type of bacillus was recovered It was found that there was no increase in virulence of the BCG strains during their stay in the body (2) Using the tuberculosis mortality rates as the gauge of the immunizing effect of BCG vaccination the authors show that vaccination is effective in the prevention of tuberculosis in children Intracutaneous or subcutaneous injection of the vaccine was found to be superior to oral administration Careful comparisons showed that the former cuts the death rate to a fourth the latter only to half (3) The authors point out from statistics of New York City that the tuberculosis death rate of children of tuberculous and open tuberculous families is only 2 7 and 7 2 per cent respectively But these are forty five times and one hundred and twenty times respectively greater than the corresponding figure among children of the general population They urge therefore, that the BCG vaccine be used as a public health measure in the prevention of tuberculosis in children of tuberculous families In view of its harmlessness and the considerable increase of resistance to tuberculosis which it confers the BCG vaccine should be given as early as possible Oral vaccination may begin within ten days of birth three 10 mg doses being administered at two day intervals The parenteral method may be used on patients of any age with a negative tuberculin test

11 Oestrin Treatment of Gonorrhoea

R M LEWIS and L WEINSTEIN (*Surg Gynec Obstet* November, 1936 p 640) report twenty four cases of successful treatment of gonococcal vaginitis in girls aged 2 to 9 years by nightly insertions into the vagina of capsules containing 75 rat units of amniotin (oestrin) Oestrin treatment in these cases is not new and its success has been ascribed (1) to exfoliation of the epithelium, (2) formation there of a cornification zone, (3) increase of the acidity of the vaginal secretion, such as has been shown by Hall and Lewis to occur in monkeys after hypodermic oestrin injections The present writers accept the last named view and found that thirteen to fifty-four days treatment induced an alkaline secretion (*p*H 7 2 to 8) to become somewhat strongly acid (*p*H about 4 8 to 6) In no case could gonococci be found in a smear when the hydrogen ion concentration was 6 or below The acidity of the vaginal secretion it was found could be accurately determined by colorimetric examination of washings in sterile normal saline On adding a drop of brom thymol blue a dark yellow colour shows a hydrogen-ion concentration near to or greater than 6 if the colour is very light green, or shades into a heavy green or light blue the reaction is more alkaline than that of such a concentration In normal children the average figure was 7 2 Doederlein's lactic acid vaginal bacillus was found infrequently, and seemed to have no relation in these children to the reaction of the vaginal tract

12 Empyema

O UTTER (*Acta chir scand* November 11th 1936 p 545) reports from Finland his observations on 282 cases of empyema in children under the age of 13 There were altogether eighty three deaths the total mortality of 29 per cent being somewhat higher for the boys (31 per cent) than for the girls (27 per cent) The mortality was highest in the first three years of life when it ranged from 47 to 41 per cent Among the sixty cases in which there was a record of a bacteriological examination there were thirty two in which pneumococci were present in the remainder various other infections were found or culture was negative The author classifies the treatment according as it was (1) limited to puncture and aspiration (2) a tube or cannula inserted between the ribs to evacuate pus (3) primary resection of ribs or (4) secondary resection as a sequel to other abortive treatment From his own experience and the literature of the subject the author concludes that when an empyema is small or only moderately large an attempt should at first be made to deal with it by puncture and aspiration only This may be repeated every other day provided the child's condition does not grow worse If after some five such aspirations there is no appreciable decrease in the volume of the empyema a secondary resection is indicated Increase of the empyema in spite of repeated aspiration deterioration of the general condition or thickening of the pus till it cannot be aspirated are all indications for draining the empyema through a metal cannula or a rubber tube He has found that the prognosis depends largely upon the choice of time at which the surgeon intervenes In his experience the irrigation of the pleural cavity with antiseptic solutions with the object of diluting the pus is not beneficial

Obstetrics and Gynaecology

13 Diet in Habitual Abortion

A TANBERG (*Nord med Tidskr* October 31st 1936, p 1785) has in six cases found that habitual abortion has yielded to a change in diet depending on the inclusion in it of green vegetables, fruit milk etc His first case dating from 1928 was that of a married woman aged 28 who had aborted four times and had only one living child Wassermann's reaction was negative as was also a gynaecological examination Curetting of the uterus proved fruitless As soon as she had been put on the above mentioned diet which included cod liver oil she again became pregnant Illness and deaths in her family entailed much running about, and she aborted in the sixth week She was now instructed not to become pregnant for half a year Meanwhile she was encouraged to adhere to her special diet and the pregnancy which ensued went to term with the birth of a normal infant A little later she again conceived and her pregnancy ran a normal course In all the other five cases the patients were given wheat germ or wheat germ oil in addition to the above mentioned diet with the object of securing an adequate supply of vitamin E In all these cases live full term infants were born It was significant that all six patients belonged to a social class in which defective nutrition would not be suspected, and it may well be that the absorption rather than the actual supply of the necessary foods was at fault Two of the patients presented definite signs of intestinal catarrh The author has also studied the influence of wheat germ on foxes kept in confinement There were three vixens who in 1932 gave birth to only two cubs while in 1933 they gave birth to sixteen under this treatment

14 Calcium Metabolism and Pregnancy

According to R MALMEJAC (*Bull Soc Obstet Gynec Paris* October, 1936, p 575) the foetus towards the end of pregnancy demands 1 to 6 grammes of calcium daily, while an average maternal diet furnishes only 0 25 gramme daily The resulting negative calcium balance may lead to dental caries, osteoporosis, and defective lactation Toxic conditions of pregnancy are to be attributed in part to deficient calcium intake, which in the early months may lead to nausea, vomiting and anorexia, and in the later months to a syndrome of hepatic insufficiency akin to that of acute yellow atrophy In pregnancy toxicoses, especially eclamptic, there is an impairment of hepato-parathyroid balance, which may be associated with hyperguanidinaemia, and which may be redressed by administration of large doses of calcium Exhibition of parathyroid extract, vitamin D, and ultraviolet radiations are useful adjuvant corrective measures The diet of pregnancy, besides being rich in calcium, or if necessary enriched by calcium medication, should contain milk, eggs, and butter, lactic fermentation by rendering the intestinal contents acid prevents formation of insoluble carbonates, phosphates, and soaps of lime, and favours assimilation of calcium

Pathology

15 Sedimentation Rate in Elderly Men

I MILLER (*J Lab clin Med* September, 1936, p 1227) reports the results of blood sedimentation rate determinations on 496 apparently normal men, mostly over 50, and three-quarters of them 60 to 80 years old The observations extended over two years, during which period fifty-seven of the men died Oxalated venous blood was drawn into 1 c cm pipettes calibrated in hundredths which were fixed vertically and in which the fall in red cell level was read at the end of one hour A fall of 10 per cent was considered to be the upper limit of normal In the group studied degenerative diseases are most prevalent, but the sedimentation rate is not affected by degenerative diseases Sixty-six per cent of all the men had rates under 10 per cent and 86 per cent rates under 20 per cent Of the fifty-seven who died, 44 per cent had rates under 10 per cent and 72 per cent rates under 20 per cent Age had little effect on the rate The results in cases of malignancy, silicosis, diabetes mellitus, pulmonary tuberculosis, bacillary dysentery, syphilis, and other diseases are given, varying rates being obtained, but the rates in inflammatory and neoplastic diseases were mostly raised In diabetes mellitus the degree of hyperglycaemia had no effect on the sedimentation rate Of the men who died and had sedimentation rates under 20 per cent, over 70 per cent died of degenerative diseases The author concludes that a single test is not sufficient, since it relates only to the presence or absence of destructive changes at the time of the test Malignant disease when localized does not cause an increase in the sedimentation rate, only when necrosis, secondary infection, and metastasis occur are the rates increased A single normal result does not rule out malignancy A high rate should be viewed with suspicion, and should prompt further investigation

16 Cerebro-spinal Syphilis

F BERING (*Dtsch med Wschr*, September 25th, 1936, p 1586) reports from the skin department of the University Hospital of Cologne studies of various reactions in the cerebro-spinal fluid indicative of syphilis, and he insists on the need for reactions so delicate, specific and reliable that they can warrant the early prophylactic treatment of syphilis of the central nervous system with artificial malaria The reactions tested were the Meinicke-Klarungs-Reaktion II (M K R II) the Pallida-Reaktion (Pallida-R), and the original Wassermann reaction Altogether 1,370 samples of cerebro spinal fluid were tested In 1,051 all the reactions were negative, and in 225 all were positive With regard to the ninety-four remaining samples, the evidence of the various reactions was contradictory In sixty-nine cases M K R II was positive and in thirty-one cases Pallida-R was also positive But there were only six cases in which the original Wassermann reaction was positive In as many as twenty cases the only reaction to be positive was the M K R II It was negative in cases of multiple sclerosis and tumours of the brain, and proved itself, therefore, of value in the differential diagnosis of these diseases and latent syphilis of the central nervous system The author puts in the order of their reliability and delicacy the three reactions as follows M K R II, Pallida-R, and the original Wassermann reaction But it should be noted that Pallida R may be positive in cases in which M K R II and the original Wassermann reaction are both negative The author is therefore of the opinion that both M K R II and Pallida-R are indispensable in the examination of the cerebro-spinal fluid for syphilis

17 Immunology of B typhosus

S C SEAL (*Calcutta med J* August 1936 p 73) reviews the recent work on the antigenic constitution and immunity reactions of bacteria and discusses its clinical implications, with special reference to *B typhosus* Of the changes in physiological characters accompanying the change from S to R form the most important are the reductions of virulence toxigenicity and antigenic properties It has been shown experimentally that S type organisms are the most important for the production of immunity Further, substances which are destroyed by overheating, boiling, or some chemical substance may play some part in immunization the Vi and H antigens ought therefore to be included in vaccine preparations As the Vi antigen is peculiar to *B typhosus* a positive agglutination with pure Vi antiserum is serologically diagnostic ordinarily, however, slide agglutination with O and H serum is nearly always sufficient although difficulties arise with some strains The preparation of diagnostic sera is discussed The Widal test performed with formolized or phenolized suspensions is a test for H agglutinins only, and these do not confer any protective immunity In view of the facts that cases of delayed response to H antigen occur and give a negative Widal test, that often O agglutinins appear before H agglutinins and that H agglutination has no value in determining the amount of protective immunity after inoculation with T A B vaccine, it is suggested that the Widal test should be modified so as to include both H and O antigens and if possible the Vi antigen The modifications necessary to achieve this are discussed The determination of Vi antibody may prove to be of importance in the serological diagnosis of carriers In the preparation of T A B vaccine the typhoid strains should contain the highest possible amount of Vi antigen in addition to smooth O antigen, both smooth V and W forms of the bacillus being included, and the paratyphoid strains should be smooth cultures with high antigenic properties The vaccine should not be heated beyond 58° C for half an hour, thus killing the bacilli with a minimum of damage to the antigens The superiority ascribed to autogenous vaccines may depend on the fact that the bacteria are used before they have undergone variation due to subculture In view of the importance of O and Vi antigens, and the relatively slight importance of H antigen, the methods of testing the efficiency of T A B vaccine need to be remodelled, possibly on the basis of protection against a lethal V typhoid strain Finally, the author discusses the possibilities of producing anti-typhoid serum The protective potency of Vi antibody against infection with living virulent typhoid bacilli and the neutralizing effect of the O antibody on the so called typhoid endotoxin seem to justify the expectation that a serum containing both these antibodies may prove to be of value in treating typhoid fever

MEDICAL RESEARCH COUNCIL

ANNUAL REPORT FOR 1935 6

The work of the Medical Research Council as set out in its latest annual report[1] is the subject of a leading article elsewhere in this issue Below we give some account of the detailed researches Much of the work has been incidentally referred to in these pages in the course of the year

Virus Diseases Transmissible Tumours

The investigations on influenza carried out at the National Institute for Medical Research have made substantial progress Evidence has been received from different countries as to the world wide diffusion of the virus originally discovered at the National Institute Patients suffering from an epidemic infectious fever diagnosed as typical influenza have been reported from parts of the world as distant as Alaska and Australia Holland and European Russia and it has been shown in all these cases that the inoculation of ferrets with filtered nasal washings from the patients causes the appearance of the same virus in the respiratory passages of these animals these ferrets will then infect others Such evidence has strengthened the probability that the virus thus propagated in the ferret is the primary infective virus of epidemic influenza in man

One of the accidents that do occasionally occur in the best regulated laboratory has proved fruitful in establishing the identity of the experimental disease in ferrets with human influenza Virus originally obtained from a human case and afterwards passed through 196 ferrets in series was used to infect another small batch of ferrets and one of these when heavily infected, sneezed violently at close range while being examined Within forty eight hours the investigator experienced the abrupt onset of a sharp and typical attack of influenza This experience, carefully investigated, furnished an important link completing the chain of evidence for the identity of the virus, maintained for over two years in ferrets as the cause of influenza in human beings

Material obtained from human patients has been used to test the possible association with scarlet fever measles and rheumatic fever of viruses transmissible to lower animals The only positive result yet obtained has been the production in one chimpanzee of a biphasic wave of fever with coryza, following inoculation with blood from a case of measles, no rash or Koplik spots were produced and a second chimpanzee housed with the first showed no symptoms Such experiences give small encouragement for further attempts, but, as in influenza, the whole prospect of success in investigating a virus disease is so transformed by its transmission to a species on which deliberate experiment can be made that further trials must be undertaken in the case of human diseases in which a virus is suspected as the infective cause

G H Eagles, studying the bacteriology of rheumatic fever and rheumatoid arthritis with special reference to the likelihood of these diseases being caused by filter-passing viruses, acting either alone or in association with streptococci, has confirmed and extended the work of Schlesinger and others that virus like bodies are present in rheumatic exudates and that suspensions of these are specifically agglutinated by the serum of patients with acute rheumatic infections but not by that of healthy persons or persons with non rheumatic diseases The aetiological role of the virus bodies is being further explored Mention is also made of an inquiry by M H Gordon into the aetiology of lymphadenoma, with special reference to the significance of the minute virus bodies which he found characteristically to occur in the lymph glands in that disease There is some evidence that these bodies may be the actual cause of lymphadenoma

Some further work on transmissible tumours is brought forward from the National Institute Success is recorded in transmitting a tar sarcoma of fowls by injecting a suspension of its cells into pheasants In all the pheasants some growth occurred and in two it continued and led to the production of very large tumours It is considered difficult to explain the results save on the assumption that a virus like agent is concerned in the production of a bird sarcoma even when the immediate provocation is a chemical stimulus and when no virus can be separated in cell free suspension from the tumour so produced

Microscopical Investigation

We noted last year the introduction by J E Barnard and his co workers of important advances in the use of ultra violet radiations for obtaining photographic images below the range of resolution by light of visible wave lengths particularly of the units of viruses The new optical facilities are affording valuable results They have enabled a combined use to be made of the original ultra microscopical equipment for photographing the images obtained by ultra violet darkground illumination and of the new equipment in which photographs are obtained of the same field illuminated by transmitted rays of the shorter wave length The object under study can be transferred from the one microscope to the other without disturbing the adjustment and the images obtained by the new method are comparable with those yielded by the ordinary visual microscope The virus units in the natural living condition are opaque enough to the short rays to give satisfactory images on the plate and the photographs so obtained can now be used as a direct check on the significance of the results by the earlier method of darkground illumination with a longer wave length

The use of a shorter wave length as transmitted radiation has made possible the approach to a new range of virus problems The units of at least some viruses appear to be far more opaque to ultra violet rays of the wave-length now accessible than most constituents of the normal cells and body fluids of the higher animals indicating that the substance of the virus units must be of relatively high density It is now possible to obtain photographs of virus units not only without fixing or staining but in their living relation to the cell protoplasm in which they occur or to extracellular fluids in which they have been shed These facilities have made possible a further study of the phases of vesicular stomatitis and foot and mouth disease The way may be pointed to a solution of some of the outstanding theoretical difficulties presented by the more finely particulate viruses

Endocrinology

A large amount of work is recorded by different investigators in this rapidly developing and changing field Reference was made last year to the anomalous occurrence and actions of certain hormones the sexual and other endocrine glands of an animal of one sex producing to some extent the hormone characteristic of the other More recent observations show that one and the same chemical substance may produce in the different sexes hormonal effects characteristic of both A S Parkes and his colleagues have found in confirmation of Butenandt that substances which may be regarded as simple modifications of the natural male hormone and which produced the effects of that hormone in the castrated male have an oestrogenic effect when injected into the female and that a small further chemical modification confers on such substances a progestational action

For the purposes of investigations which were being made for the Therapeutic Trials Committee of the Council it became important to consider the methods available for the assay of sex hormones in human body fluids and

excretions These methods were found to vary greatly, and a comparative survey has been undertaken by R K Callow at the National Institute of the results obtainable by the different methods of chemically liberating and extracting each hormone from the different fluids Some work—as yet negative in result—has also been done following on the discovery by Collip of Montreal that an animal can be immunized against the action of certain hormones of the anterior pituitary lobe by repeated injections of extracts containing excessive amounts of the hormone in question The point arises whether an animal can produce the antibody in response to an excess of its own hormone Experiments so far made by Parkes and his colleagues have not succeeded in eliciting whether an animal can in fact be immunized against an extract of pituitary material of its own species containing the hormone in as natural a condition as possible

Standardization

The National Institute maintains the regular distribution of the biological standards which it holds under the Therapeutic Substances Act or on behalf of the Health Organization of the League of Nations, or for the purposes of the *British Pharmacopoeia* The Institute has now accepted responsibility for the standards for neoarsphenamine (neosalvarsan) and sulpharsphenamine Both these standards have been submitted for trials to the control laboratories of several countries, and, their suitability to serve as international standards having been confirmed, they have been distributed to all countries making arrangements for their official application The new standard preparation of insulin described in last year's report has been distributed to various countries in the Eastern Hemisphere, the distribution in North and South America is made by the Insulin Committee of Toronto

The national collection of type cultures of micro-organisms continues to be accommodated at the Lister Institute The number of cultures of bacteria and fungi distributed during the year under review to workers at home and abroad again exceeded 5,000, and some 200 new types were deposited for maintenance

The Standards Laboratory in the School of Pathology at Oxford maintains the work of producing and standardizing bacterial suspensions and serums for the diagnosis of enteric, dysenteric, Brucella, and meningococcal infections Suspensions and antiserum of *Bact dysenteriae* (Newcastle) and of the porcine type of *Br abortus* have been maintained for supplying to research workers, and the former will probably soon be added to the official list of products available for issue

Cell and Tissue Growth Malignant Disease

The report embodies the work on cell and tissue growth carried out at the Strangeways Research Laboratory, Cambridge C H Waddington has extended his studies of the development and differentiation of the primitive tissues of the embryonic chick, he has also proved that the mammalian embryo contains an "organization centre" by showing that suitable fragments of embryonic rabbit can induce the growth of nerve tissue when grafted into the early chick embryo By irradiating tadpoles Glucksmann and Spear have confirmed their observations, made first on mammalian tissues, that cellular degeneration after exposure to radium or x rays is preceded by an interference with mitosis and a reduction in cell division It was found also that the degree of cellular degeneration produced in tadpoles by a given dose of gamma rays was related to the intake of food being greater after feeding than after starvation, and this work is being extended

At the Royal Cancer Hospital London, experiments are being made on the synthesis of compounds likely to have the physiological activity of the female hormone oestrone A Cohen has prepared a series of transformation products of colchicine, the alkaloid present in autumn crocus, which is known to inhibit cell division and has been stated to arrest the growth of malignant tumours Many of the colchicine derivatives have a similar effect on cell division, and experiments in this field are being continued with the object of finding a substance less toxic than colchicine which might have application in the treatment of cancer

Some further work has been done at the National Institute on the continuous exposure of mice to dust from tarred roads, with resulting production of skin cancer and an increase in the number and sites of adenomata in the lungs A control experiment in which the dust was previously freed from tar by prolonged extraction has shown that the warty growths and cancers of the skin are no longer produced, and that there is no such excess of primary lung tumours as were forthcoming with the tar-containing dust It should be noted that no practicable way of extraction would render the dust absolutely free from traces of tar constituents adsorbed on its particles In view of the importance of the question whether the dust from tarred roads plays any part in the apparently growing incidence of pulmonary tumours in men these experiments are now being extended to rabbits and guinea-pigs, the skins of which do not show the same susceptibility to contact with the tar dust as do those of mice

The remainder of the report, including the work under taken at the clinical research units which are in part staffed and supported by the Council at three London hospitals and also the many external research schemes in which grantees of the Council are working, will be mentioned in a later article

---

Dr Guns (*Scalpel*, Liege December 26, 1936, p 2537) is of the opinion that the treatment of an acute cerebral abscess by puncture pending the formation of a capsule which can be enucleated is not ideal, and points out the high mortality following this method of treatment Two personal cases are fully described, one acute and the other a chronic abscess of the brain The first case occurred in a child of 6 years, who had suffered from otitis media and otorrhoea When seen the child had retro auricular pain on the left side and violent headache Hot dressings were placed behind the ear and instillations of oxygenated air and mercurochrome were given A few days later she became comatose, the left ear was full of pus, and the mastoid region was tender on pressure The brain was explored and 10 c.cm of pus containing anaerobes was withdrawn Decompression was then carried out The child remained gravely ill and daily lumbar puncture was necessary On the fifth day coma set in again, and it was decided to drain the cavity After a stormy period with cerebral vomiting and meningeal signs the child gradually improved, and the drain was replaced by a dressing A fortnight after the first lumbar puncture the patient was completely cured In the second case a man of 57 was suffering from otorrhoea in the right side with retromastoid pain At operation it was seen that there was extensive necrosis of the whole mastoid area and pus was evacuated from an extradural abscess and from the temporo-sphenoidal lobe About 30 c.cm of pus came from the cavity, which was drained The drain was removed on the fifth day, the meninges were incised, and a gauze drain with iodoform was left in the cavity This continued to drain for six weeks, by which time the patient had completely recovered A third case is described, in which the patient made a similarly good recovery It is considered that drainage of a cerebral abscess should be the procedure of choice and that enucleation of the abscess should only be carried out in exceptional cases The value of a large decompression is also emphasized and of injection of sterile air into the abscess cavity

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MARCH 20 1937

THE UNITED RESEARCH "FRONT"

The layman perhaps, is apt to think of the Medical Research Council as a body or congregation of bodies working in a laboratory on Mount Olympus, far removed from the toils and sufferings of ordinary medical practice The researches it fosters are thought to be such as may at some future time prove useful in the healing or prevention of disease but for the present have an academic interest only A perusal of the report of the Council for 1935–6 —a very readable document [1] especially its comprehensive introduction—on the contrary reveals a body which is all the time concerned with clinical medicine correlating at every point the work of the laboratory with attendance at the sick bed The outstanding matters discussed this year are such subjects as influenza nutrition the prevention and treatment of childbed fever, and the lessening of the ravages of epidemic diseases, all of which are the everyday preoccupations of the general practitioner

The report this year sounds a special note of triumph for the most noteworthy event so far as medical research is concerned is the Nuffield benefaction to Oxford, and the way that gift is to be used is exactly in line with what the Council has always preached, though it has not been able to summon millionaires to Old Queen Street, Westminster It has continually urged the establishment of senior clinical posts on a whole time or nearly whole time basis Three years ago it reiterated its strong belief in the primary necessity of establishing a greater number of senior appointments for whole-time work in research and higher teaching such as would offer the possibility of a satisfactory career in later life to young men who wish to devote themselves to the scientific study of clinical problems Research in clinical medicine and surgery is greatly handicapped by the fact that careers in these subjects depend too closely upon success in private professional practice Clinical science has offered no prospect of a career comparable with what is afforded in the laboratory branches of medicine by the existence of numerous whole-time academic and research posts The result has been that the promising clinical investigator has become increasingly absorbed by the claims of Harley Street It has been with him as with good Edmund to change one word of Goldsmith's lines

> Who born for the universe, narrowed his mind
> And to practice gave up what was meant for mankind

It has been the declared policy of the Council to establish as opportunity offers and resources permit positions in its own service for whole time clinical research The Nuffield gift has now not only endowed Oxford in this respect, but has set an example which it is hoped will be followed elsewhere Another aspect of the problem to which the Council has been giving attention during the past year is the training of young clinicians with a view to academic and research appointments To this end it has instituted a series of post graduate studentships and research fellowships in clinical science and experimental pathology—six of the former and four of the latter—the object being to encourage young medical graduates of special ability and original mind to become investigators in those branches of medical science which are concerned directly with disease in human beings

The Medical Research Council interests itself also in those problems which, partly medical have an important social bearing as well The public interest in nutrition and the determination of the Government to improve the physical fitness of the nation (to which proper nutrition is a necessary corollary) are reflected in the present report Here again the Council can regard its earlier action with some satisfaction For some years it has assisted in special inquiries into the amount and type of food eaten by representative communities of people in Great Britain One interesting point brought out by these reports is the relative consistency in widely separated communities of the proportions of protein fat, and carbohydrate in the food, although the foodstuffs which are popular vary much in the different places The instinct of the housewife or some more mysterious factor seems to adjust the balance whatever the local custom or fancy may be In St Andrews, Cardiff, and Reading for example taking in each place the diet of a number of families the proportion of protein was found to vary as between one town and another by less than 1 per cent. These figures are the more interesting because of the different type of foodstuffs favoured by different communities Why is the homely sausage only half as popular in Cardiff as it is in St Andrews? Why is butter eaten almost universally in Cardiff and substituted very largely by margarine in Glasgow? And it is also permissible to ask from these figures whether Scotland stands where she did, for whereas in 1911 nearly

INSURANCE ACTS COMMITTEE OF THE B.M.A.

REPORT OF MARCH MEETING

The Capitation Fee

The meeting of the Insurance Acts Committee on March 11, over which Dr H G DAIN presided in the regretted absence, through illness of Dr H C Jonas was very largely occupied with the case for an upward revision of the capitation fee It was stated that the Minister of Health and the Secretary of State for Scotland were prepared to receive a deputation on the subject later in the day and it was resolved that the entire committee should attend at the Ministry with Dr Dain as its spokesman The draft statement of the case to be put forward by the Committee was examined paragraph by paragraph The Committee devoted a couple of hours of constructive criticism to the memorandum which was with a few verbal alterations unanimously approved One member in proposing a vote of thanks to the subcommittee whose main work it has been said that he could not recall a document of this length and importance which had gone through with less alteration In acknowledging the compliment a member of the subcommittee referred appreciatively to the work of Dr Hill Deputy Medical Secretary of the Association who is secretary to the Committee A small team, consisting of Dr Dain the Chairman of the Conference of Local Medical and Panel Committees (Mr Elliot Dickson), Dr Gregg Dr Greenfield and Dr Hill was appointed to represent the Committee in the presentation of the case to the board of arbitration which it was anticipated would be set up

Regional Medical Officers

The question of the capitation fee rather overshadowed other business but much of this was important A communication was reported from the Department of Health for Scotland in reply to representations from the Committee as to the age limit for appointments to the Scottish regional medical service The Committee had suggested an age limit with a minimum of 35 and a maximum of 50 but the Department saw no reason for any suggestion that the standard of recruitment for the regional medical service in Scotland was in any way inferior to that in England and Wales or that it had suffered by the recruitment of relatively young doctors to junior posts While not prepared to accept the Committee's suggestion it promised to keep it in mind when considering the filling of future vacancies in the service

The Chairman said that this whole matter not specially in relation to Scotland was one on which some misgiving might be felt Recent appointments had been made of people with less experience in general practice than was formerly the rule and although there was a requirement that a certain number of years should be spent in practice there seemed to be a tendency by the appointment of junior officers to make this qualification a minimum The result might well be a generation of regional medical officers less able to help and advise practitioners in their insurance practice It was a situation that needed to be watched

Cost of Drugs and Appliances

A lengthy communication from the Ministry of Health was reported on the question of the cost of prescribing It drew attention to the continuous increase in this cost For the country as a whole comparing 1930 with 1935 the average number of prescriptions per insured person rose from 4 12 to 4 60 the average cost per prescription from 7 95d to 8 06d and the average total cost per insured person from 32 8d to 37 1d The figures available for the first six months of 1936 showed further increases The point was also made that certain areas

100 per cent of the Glasgow families investigated ate oatmeal in 1933 not much more than half of them did so The year has seen the completion of a striking piece of work on the subject of nutrition, with the issue of the final report on the investigation, occupying seven years, directed by the Council's Committee on Dental Disease, in particular on the influence of diet on the decay of children's teeth The results of the later work support convincingly the earlier findings as to the essential part played by particular qualities of the diet in the proper development and maintained health of the teeth and jaws Though many aspects of this important problem still remain to be solved, it is considered that this report of the Committee on Dental Disease marks the end of a round in the fight of modern research against dental caries The implied congratulations to Mrs Mellanby on the successful conclusion of the work which she began several years ago must have given special satisfaction to the secretary of the Medical Research Council

Finally—though only finally so far as this cursory review is concerned, for a vast amount of other work has been done or encouraged—there may be mentioned another problem, which is both medical and social, to the elucidation of which the work of the Council has contributed—namely, that of maternal mortality and morbidity Reference is made to the work on the German dye red prontosil, which has been carried out at Queen Charlotte's Hospital More clinical and laboratory tests are necessary before an accurate appraisement of the situation can be made, and another reason for delaying judgement is that present experiments promise even better results with the colourless substance para aminobenzene sulphonamide, which is allied in composition to red prontosil and is in fact its chemical parent A favourable report of the results of giving this substance to patients with puerperal sepsis was published by Foulis and Barr in the *Journal* of February 27, and clinical tests are also being made at Queen Charlotte's On the whole problem of puerperal sepsis modern research has transformed the outlook both for its elimination and for its treatment While the problem on the one side is being tackled by the institution of ante natal clinics and improved midwifery services, it remains for medical research to discover wherein lie the dangers of infectivity in childbirth and how these can be avoided and treated By what means can childbirth on the basis of recent research be made secure from sepsis?

It is quite certain that we ought not to rely, in the first place on curative drugs Clearly the ideal to be aimed at in any disease is to prevent its development and thereby make any alleviating remedy unnecessary This is especially true as regards disease associated with the natural process of childbirth Modern investigation suggests two lines of prevention First, childbirth should be so conducted that access of pathogenic organisms to the birth canal of women must be rigorously excluded, especially streptococci associated with sore throat, whether in the respiratory tracts of medical attendants, or of friends, or of the patients themselves Secondly, the diet of pregnant women should be of such a nature as to raise the resistance to infection to the highest possible level this means an ample consumption of milk, green vegetable, and other protective foods If for any reason, known or unknown, these first two lines of defence are broken down and puerperal sepsis does develop, then is the time to bring into action the third line of defence—namely, the treatment which evidence suggests is now available"

We begin on another page some more detailed account of work covered by the report How voluminous it is may be indicated by the list of twenty investigation committees for special subjects, ranging from anaesthetics to mental disorder, from statistics to bed-bug infestation, from tropical medicine to human genetics The report itself should be read Much of it is necessarily formal and prosaic, but it requires little imagination to see that it becomes a collection of dispatches from a part of the front where the fight against disease is being very effectively waged

THE BIRCHING OF CHILDREN

A recent letter in the Press, signed by medical men and psychologists, drew attention to a report that "at the Aldershot Juvenile Court on February 8 three boys, aged 10, 11 and 12, were ordered to receive six strokes of the birch each" The letter went on "to protest against the imposition of such punishment, which is not only inhuman but reveals the court's ignorance of the scientific treatment of delinquency" With this protest medical men will be in general agreement It is therefore of some interest to examine the attitude of the public to this question as revealed in legislative enactments The Children and Young Persons Act, 1932, was the culmination of a movement which began with the Probation Act, 1907, and which has introduced an entirely new spirit of humanity and reason into the administration of law Among other innovations it set up juvenile courts, in which the young offender meets the magistrates in kindly and informal surroundings, more like those of a family council than of a criminal court Provision is also made for full investigation of the mental make up of the delinquent The whole stress is on turning him from the paths of crime into useful citizenship, on showing him that it is far more attractive and satisfactory to do lawful than unlawful things When the Government draftsmen were overhauling the Summary Jurisdiction Act, 1879, to decide

reasonably comparable as regards industrial condition and character of population differed widely as regards prescribing costs Thus Rochdale showed 4 8 prescriptions per insured person while Salford, with approximately the same proportion of insured population treated (60 per cent) required seven prescriptions Similar discrepancies revealed themselves as between Blackburn and Bolton Leeds and Wakefield and Birmingham and Wolverhampton

The Chairman suggested that a detailed matter of this kind was one which could most appropriately be dealt with by a small body rather than in a large committee, and accordingly a representative subcommittee of seven members was appointed to consider and report upon the subject A communication was also received from the National Association of Insurance Committees whose executive desired to confer with the Insurance Acts Committee on the subject It was the view of the Committee, however, that this was a matter rather for internal consideration and not for consultation with outside bodies at the moment, though no doubt the Ministry would make such consultations as it thought fit

Drugs in a National Emergency

A list of drugs necessary for the civil population in a national emergency—which being interpreted means war or stoppage of imports—was forwarded by the Ministry of Health for comment by the Committee The list was of surprising extent, numbering 160 preparations It had been sent to a member of the committee who is an acknowledged expert on pharmacy Mr Lewis Lilley and he had suggested some additions and deletions A further letter from the Ministry stated that only those drugs had been included which would be generally agreed as quite essential This would exclude drugs of the adjuvant class and those the use of which was in more or less an experimental stage Moreover, only one representative member of a class of drugs having somewhat similar action was mentioned as absolutely essential

The feeling of the Committee was that even so the list could be very drastically pruned and that it might be a real service to suggest which drugs must be regarded as indispensable The task of clarifying the list from this point of view was again committed to Mr Lewis Lilley

School Medical Records

The Ministry which seemed to be an unusually prolific source of documents at this meeting, sent forward a memorandum on school medical records Suggestions have often been made that it would be useful if insurance practitioners could by some means have access to the school medical history of their young insured patients It was now suggested from the Ministry that probably the simplest way of proceeding would be for a practitioner who desired such particulars in an individual case to ascertain his patient's last school and make application to the local education authority concerned for the supply to him of any such particulars as might, in the opinion of the school medical officer be likely to be of use To this end it is contemplated that school medical records shall be preserved for five years after the person concerned has left school

The Chairman said that this scheme seemed most attractive but it might not be so helpful as it at first appeared The school medical record would contain the history of a series of periodical examinations and any defect such as stunting of growth or shortness of sight would be indicated but a child might well have suffered from illnesses at one time or another of which there would be no history at all and yet it was these illnesses about which the insurance practitioner particularly wanted to be informed

The Committee approved the Ministry's suggestion while conscious of the limitations just indicated

A Question of Partnership

A communication from the Buckinghamshire Panel Committee raised again the old question of partnership between a practitioner who was doing insurance work and another who was not It was mentioned that Buckinghamshire Insurance Committee had proposed to ask an insurance practitioner to agree that his non-insurance partner should not charge fees to his insured patients Dr Rose said that the point had since been put to the Ministry and a reply received to the effect that there was no ground upon which exception could be taken to a partnership between an insurance practitioner and a non-insurance practitioner

The National Insurance Defence Fund

Sitting as trustees the Committee considered the proposal of Dr J A Brown of a method for securing large additional sums for the defence fund Dr Brown's scheme was that Panel Committees should be asked to raise a new levy on the same lines as the present one, but that accounts should be furnished showing the amounts subscribed by individual practitioners The subscriptions so raised should be placed to the credit of a new and separately administered fund and not used unless the present one was exhausted The subscriptions to the new fund would be returnable to subscribers on retirement from insurance practice or to their executors in the event of death Suggestions were also made as to the use of the interest earned

The Treasurer (Mr Bishop Harman) said that Dr Brown's was an ingenious scheme, but one which would be very difficult to apply, largely because of the vast amount of clerical work it would involve in necessitating the opening of 17,000 ledger accounts Dr Brown thought that the cost and difficulties of running the scheme had been exaggerated

The general question of increasing the amount to be aimed at by the Defence Fund was postponed for three months in view of the preoccupation with regard to the capitation fee

Scotland

Dr Thomas Fraser, chairman of the Insurance Acts Subcommittee for Scotland, brought forward the minutes of two meetings covering a large range of matters The subcommittee, arising out of the position in Glasgow with regard to the institution of a whole-time maternity service, had asked the Department of Health whether it agreed with the conclusions of the Committee on Scottish Health Services on action by local authorities and the principle of free choice of doctor The reply received was to the effect that the question put was part of the wider question of the extension of medical benefit to the dependants of insured persons and others The matter was still under consideration by the Department

The question of medical records had lately figured largely in the work of the subcommittee Its representatives had met the Controller of National Health Insurance in Scotland, who had informed them that the attention of the Department had been drawn to the large and increasing burden on national health insurance funds caused by chronic incapacity, half the days of incapacity were due to this type of case Therefore it had been resolved to postpone the proposed inquiry into tonsillitis and substitute an inquiry into chronic incapacity

It was reported that the Department of Health proposed to amend the Medical Benefit Consolidated Regulations for Scotland made in 1929, but before doing so had requested the views of the subcommittee and of the Scottish Association of Insurance Committees The subcommittee reappointed a team consisting of Dr J G McCutcheon, Dr D N McGillivray, and the Scottish Medical Secretary to deal with the matter

which parts of it dealing with children and young persons ought to be repealed they thought it logical and in keeping with the whole scheme to reject the provision under which a magistrate's court could sentence a child to six strokes of the birch, and the companion provision by which a court could award twelve strokes for more serious offences As the Government spokesman pointed out in introducing the Bill, judicial birching was dropped because the magistrates' courts had almost ceased to inflict it, and the Government felt that it had fallen into general disfavour and was a thing of the past When the Bill came before the Lords, however they inserted an amendment in committee which proposed to re-enact, word for word, the old section, which provided for six strokes of the birch Peer after peer expressed strong disapproval of the Government s action in repealing the section, and so indispensable did their lordships consider the judicial birching of children that they defeated the Government by 65 votes to 22 The Commons rejected the amendment unanimously but the Lords insisted on retaining it Birching therefore remains, and its use is on the increase

Strong language has been used against judicial birching in Parliament and outside The case against it is that it can have no good effect and that it is bound to cause a mental injury that will result either in neurosis or criminality The whole procedure imposes an intolerable strain First the child—who, under the new Act may be only just 8 years old—may have to wait several days for the hearing secondly, the solemn and im personal sentence is in itself harmful thirdly, the circumstances of the punishment are terrible and inhuman The child is taken into a bare gloomy room his clothes are removed, and he is tied up hand and foot to a tripod after the police surgeon has examined him to see that his heart will stand the whipping A police constable wields the birch —a heavy bundle of twigs that has been soaked in brine—and after each stroke the doctor again examines the child He makes a final examination after the child is released and administers any necessary treatment The child is not usually fit to attend school for two or three days The Earl of Listowel who raised the subject in the House of Lords in 1933 (Official Report July 25, vol 88 col 1083) quoted anonymous Harley Street specialists as authority for saying that no child in England can stand six strokes of the birch rod as judicially administered without becoming a nervous wreck for months perhaps years or a hopeless criminal degenerate The view in favour of retaining the punishment rests on the assumption that there is a certain small class of children who commit acts of great cruelty or wantonly endanger the lives of others and who will respond to nothing but birching as judicially administered Some of the Lords who spoke in favour of retaining the birch (Official Report 1932 May 26, vol 84, col 450) said that the Departmental Committee on the Treatment of Young Offenders, which reported in 1927, had recommended the retention of whipping almost unanimously, and Viscount Snowden for the Government, confirmed that only three members had been against it Viscount Bertie of Thame, who moved the amendment to insert the rejected words of the 1879 Act, gave an instance of the kind of offender for whom the birch was indispensable five boys who killed and maimed a number of sheep with iron bars He said that the police constable was the natural monitor of the working class child who expected, if he were caught, to be beaten by the policeman The Earl of Glasgow pointed out that whereas the Dominions would reject a young immigrant who had been imprisoned they did not mind one who had been birched Lord Danesfort deplored the "humanitarian and ultra sentimental" view, and suggested half humorously, that the Government in abolishing whipping were running in the face of Holy Writ and ignoring the advice of Solomon the Wise Lord Atkin could not object to a short and sharp punishment of the kind which such children ought to be given in their own homes, and Viscount Exmouth testified that the possibility of a good whipping was an indispensable deterrent to hold in reserve for rare and really bad cases and that the successful running of an industrial school depended on its existence

It is probably as difficult for legislators as for other people to think dispassionately in devising punishments to fit crimes The method by which birching is carried out suggests that vindictiveness as a motive was not absent from the minds of those who in the first place prescribed this barbarous treatment for juvenile delinquency It is, we suggest, as much an anachronism as hanging for the theft of sheep A judicial birching whatever may be the injury to the mind of a growing human being might well confirm the offender in his potentially criminal ways The aim should be not to *punish* the delinquent but to discover what social, familial and personal factors are responsible for his anti social tendencies and to institute treatment to correct them To tie him hand and foot to a tripod and flog him with a brine soaked birch seems the best way to make a boy of 8 years look upon society as his natural enemy To condemn such a form of punishment is not sentimentality and it is to be hoped that the more enlightened attitude of the law to juvenile criminals and delinquents will lead to its abolition

METROPOLITAN COUNTIES BRANCH OF THE B.M.A.

RECEPTION TO FINAL-YEAR STUDENTS AND NEWLY QUALIFIED PRACTITIONERS

Address by Dr Cyril Norwood

The annual reception of the Metropolitan Counties Branch of the B.M.A. to fifth year students and newly qualified practitioners was held at the Association House on March 9. Dr PERCY SPURGIN presided, and those attending almost filled the Great Hall.

Dr CYRIL NORWOOD president of St. John's College Oxford gave an address on "A Layman's View of Doctors." He began with an allusion to the Dialogues of Plato one of those moderns who has really some thing to say and understands what he is talking about. Plato discussed two classes of doctors those who practised among the rich and those who practised among the poor he called these two classes slaves and freemen. Drop ping that old-fashioned terminology about slaves and freemen and substituting panel practitioners and Harley Street would it be necessary to alter much or any of the rest of it? He seemed to have heard of panel practi tioners who got through an enormous number of dis pensary patients and a very large number of private visits in a day and he wondered whether it could be true that they never talked to their patients individually or let them talk about their individual complaints. There did not seem to be much time to let them talk if conditions were what they said they were and perhaps they did prescribe what mere experience suggested. And there was that other method practised among the freemen of Athens in the fourth century B.C. which seemed to carry some modern ideas even that of psycho-analysis (of a sane kind indeed) since the doctor carried his inquiries far back and studied his patient carefully as an individual winning his confidence and gaining information while apparently instructing his patient. Plato's description of the freeman doctor read to him uncommonly like what a good doctor tried to do to-day and he could not help feeling that if Plato were lecturing on the methods of medical practice in London at the present time he would not seem very much out of date.

Three Types of Patients

The young practitioner would naturally ask himself what his patients were going to be like. In most respects he supposed they would be very much like the doctor himself. It was Bernard Shaw who had said that the doctor was of the same clay as the ignorant shallow credulous half-miseducated feverishly anxious people who called him in when they had tried in vain every bottle and every pill the advertising druggist could persuade them to try. There would be among them a certain number of people of exceptional ability and a very large number of people round about the average together with a certain number of the really stupid to balance the clever ones. It was not a very helpful division from the point of view of those he was addressing. There was another classifica tion he would use which split people into three a little class and a big class and again a little class. There were in the general public three types of people those who disliked and detested doctors those who—the normal people—wanted to be helped and were ready also to be friendly and grateful and again the small class of those who idealized the doctors and regarded them as super men.

To take the first type to which Dr. Norwood said he did not himself belong there was he thought something wrong with their digestive system. They were like Thomas Carlyle who hated doctors and would have nothing to do with them but wrote continuously accounts of the bodily tortures which he suffered. All his life he grumbled about his inside and the ill health under which he laboured and in return he took it out of his wife first his fellow men second and the universe third and lived to be 85 and saw everybody out. If he had not disliked doctors quite so much some people would have been happier. However Carlyle was not typical, and there was only one of him in the nineteenth century. Those who disliked doctors whom he would call the cynics were wont to state that the whole medical profession was one great ramp and that its real purpose, in spite of its ideals and much advertised unselfishness was to transfer money from the pockets of the public into its own.

But these people who included enthusiasts fanatics and others made but a small group and the great mass of patients were just ordinary folk looking for a helping hand and a friend in need. He thought that it was friend ship and sympathy that they most wanted to have—the faint heart made bolder or fear chased away. If they were educated and intelligent they wanted to know the why and wherefore of illness and the reason for treatment. A little tutorial instruction they took as a compliment to themselves and it went a long way with them. But if they were not educated or particularly intelligent then he was afraid they liked to have something tangible other wise they would think that the doctor was neglecting them. And he supposed that most doctors being kind hearted and not liking to disappoint their patients would oblige them. Most human beings wanted to be friendly and to be treated as friends and he was sure that a capacity for friendship carried a man further in private practice even than profound knowledge. The doctor who had not got this friendly touch sometimes repelled and frightened his patients though he might as a matter of fact be extremely skilful.

Then there was the third group who sentimentalized idealized and worshipped the doctor. It was pleasant to be the centre of such affection and trust but it had its disadvantages. These people called on the doctor at all hours and seasons by day and night for slight cause. because they knew he was so unselfish and they were sometimes slow about paying his bill because they knew he was so generous and in any case had a soul that was quite superior to financial considerations.

Private Practice versus State Service

At a later stage in his address Dr. Norwood discussed the question of private practice versus a whole-time State medical service. There were those who argued that what was wrong with doctoring in this country was the existence of competitive private practice for it subjected young men who were not rich to conditions which were too strong for them, and drove them to give less than their best. The man could not get far ahead of his patients. It was very easy to get into the way of doing what was likely to be popular with them and not what was best for them. The need for earning fees since a man must live and lay a foundation for future advance might lead him to exploit the neurotic the humbug and the well to do who enjoyed being ill. There were other drawbacks to private practice or at least so they seemed to him looking on it from the outside. Such practitioners had to work too long for their patients never let them off. The more popular the doctor and the more his patients liked him the more unmerciful they would be in their demands.

Thus if one set about it a very strong case could be made against private practice and in favour of the view that the reputation of doctors would stand higher still if they were all servants of the State. It was easy to picture such an ideal. Here was the young doctor animated by a hatred of ill-health and the social conditions which made for disease and in the State service he could advance the borders of knowledge still further and was not hampered by the necessity of private gain. Under the [illegible] he supposed the country would be divided into provinces each with its medical officer in charge with his assistan

RENAL RICKETS AND THE PARATHYROID GLANDS

Whereas the association of adolescent or "late" rickets with chronic renal insufficiency has been recognized for many years, the underlying pathology is by no means clearly understood It was once held that retention of phosphorus, due to the impairment of renal excretion, interfered with calcium metabolism—a theory which was discarded when it was observed that renal rickets might occur without an abnormally high inorganic blood phosphorus Mitchell then suggested that the excess of phosphorus which could not be excreted by the kidney was excreted into the bowel and there combined with the calcium of the diet to form insoluble calcium phosphate The rickets was thus to be regarded as the result of calcium deficiency, and this view was supported by Salvesen's observation that administration of calcium lactate in large amount improved both the clinical and biochemical state of a patient with renal rickets and uraemic symptoms, although it provided no permanent cure Recently enlargement of the parathyroids has been noted in several cases of renal rickets, and has given rise to an endocrine as opposed to a primarily renal theory of origin Chown has even gone so far as to suggest that both renal and bone lesions, and the lack of growth, are the outcome of a pituitary lesion, though there is little to support this contention Dr N L Price and Professor T B Davie[1] give a detailed clinical and pathological report of a case, that of a boy of 14, in which enlargement of the parathyroid glands was associated with renal rickets of the osteoporotic type and calcinosis of the kidneys They draw attention to the two radiological types of renal rickets described in the literature—namely, that in which there are florid rachitic changes at the ends of the long bones, and that in which there is general osteoporosis, with loss of distinction between the cortex and medulla, and in which the cupped metaphysis shows a ground-glass, woolly, or moth-eaten appearance with varying degrees of stippling They claim that this latter type is to be correlated with overactivity of the parathyroid glands, and emphasize the importance of calcuria and the presence of foci of interstitial or even intratubular calcification in such cases In their view renal rickets should be looked upon as "the common ground of overlap" of hyperparathyroidism on the one hand and of chronic renal damage on the other At the one extreme are those cases with enlargement of the parathyroid glands and possibly some pituitary dysfunction in addition—the "endocrine" group—and at the other are those in which congenital abnormalities of the renal tract are associated with renal insufficiency A further study of the relation of renal insufficiency to the parathyroids has been carried out by Pappenheimer,[2] who with Wilens had previously produced evidence that in chronic nephritis enlargement of the parathyroids was constant and proportional to the renal damage Pappenheimer has now studied the effect of experimental reduction of kidney substance on the parathyroid glands and skeletal tissue Using healthy white rats weighing from 150 to 250 grammes he removed one kidney by the lumbar route and destroyed a considerable part of the opposite kidney by thermocautery Unoperated litter mates were used as controls and all the animals were kept on a mixed diet They were killed after a variable time, and the volume of the parathyroids was determined A decided increase in parathyroid tissue was demonstrated in the operated animals as compared with the controls Measurement of the nuclei of the cells suggested that the increase could be accounted for, in part at least, by an increase in the size of the cells Mitotic figures were rarely discovered Changes simulating an advanced stage of glomerulonephritis were observed in the remaining kidney substance Further experiments, in which both the nephrectomized and control animals were kept on a low calcium diet, showed that whereas the low calcium diet resulted in some parathyroid hyperplasia in both operated and control animals the hyperplasia was much more marked in the former The partially nephrectomized animals were stunted in growth, and the histological changes of florid rickets were found in the bones Pappenheimer considers the results obtained to be comparable to renal rickets in man He points out that the crucial experiment, yet to be performed, will be to study the effect of experimental renal insufficiency in the absence of the parathyroids in order to demonstrate the role of these glands in the production of skeletal changes

EXPERIMENTAL SILICOSIS

There is so great a variety of dust hazards in industry that we need an experimental method by which the danger of any particular dust can be determined At one time the exposure of animals for long periods in a dusting-chamber was the only recognized way of performing such an experiment and its one merit was that of being strictly imitative, the procedure was laborious and the results slow and uncertain The intratracheal injection of a suspension of the dust a method introduced by the late Professor E H Kettle, was a vast improvement on the dusting-chamber and combines facility of execution and certainty of effect with the significance which must attach to the production of lesions in the lung itself rather than in other organs Nevertheless other methods of parenteral injection have been adopted with the same end in view, including even the intravenous route one of these is intraperitoneal injection in guinea-pigs, advocated in several previous papers by Miller and Sayers who now publish[1] an amplified series of studies by this method Dust so injected collects chiefly in the peritoneum of the abdominal wall, and any lesions produced can therefore be readily studied in that situation Three types of reaction were observed The "absorptive" reaction consisted in the formation of nodules which afterwards diminished in size, and was elicited by calcite, limestone, gypsum, and Portland cement In the "proliferative" reaction, caused by pure quartz and other similar mineral dusts, nodules were formed which continued to increase in size for three months

medical officers, and the provinces would be divided, like a diocese, into parishes in each of which there would be a subordinate medical officer. In each province there would be hospitals and subhospitals, research stations, and staffs of specialists to whom inquiries could be addressed. The one aim of the service would be to apply knowledge to the promotion of health and to seek not so much to cure illnesses as to prevent them.

'It is a magnificent picture in many ways but I am not carried off my feet by it you see, I was once in the Civil Service myself, and it doesn't make you a superman. I can conceive a hardening, even an ossification of medical practice. I can foresee a control by the old men who have become so great that they have lost touch with the human patient, and thus the creation of a medical orthodoxy singularly dangerous in view of the fact that medical opinion and medical practice are rather fluid and apt to change. There have been a good many changes even in my lifetime though you can supply a list of them with your technical knowledge much better than I. I am not particularly impressed by the official medical services which already exist. They are not the seed bed from which new ideas come.

'In conclusion, Dr. Norwood said that as a layman he thought it perhaps not an exaggeration to say that in the majority of everyday cases half the secret of healing lay in the personal factor: the confidence which the doctor inspired, the sympathy which he established between himself and his patient. There was not and could not be the same intimate bond between a patient and an official when the patient felt that he had ceased to be known as a personality and had become a number. The part which private practice and private enterprise could play in the future was going to be smaller that was inevitable. There must be a further growth of the system of medical officers of health and that could not but work out on the whole for good so long as the local provinces were allowed a good measure of autonomy, the right to meet and deal with their own local problems in their own way, and so long as their freedom to impart and to discuss results was maintained.

Another extension which he thought was bound to come was a medical service which would improve the physical education of the country. It had further to be remembered that the mass of medical knowledge was so vast and detailed and so continually growing that more and more men must specialize in one selected part of the field, and therefore the general practitioner must rely increasingly upon the specialist and refer to him.

Yet with all these qualifications he held to his conviction that if private practice were allowed to disappear some thing would be lost from the national life which would not be regained. Human beings tried to present a bold front to the world, but it was an old saying, and he thought it true, that there was a skeleton in most cupboards. In most families there were fears, or troubles, or anxieties besides the incidence of ill health. The family doctor who could win confidence and inspire friendship became not only the healer but might be the adviser, the comforter, the encourager, a sort of amateur parson, an amateur lawyer, and always a strength upon which the weak could lean. "All this side of his work may not be highly scientific or of professional interest, but if there were no more brass plates in village or country town or suburb there would vanish from the social life of this country an element of rare value which medical officers under the local authority and professional welfare workers would find it quite impossible to supply."

At the close of the address a vote of thanks was proposed to Dr. Norwood by Mr. L. L. WHYTEHEAD (Middlesex Hospital), who said that in hospital students were well taught how to diagnose and treat disease, but the knowledge of how to understand and treat men and women patients might largely have to be acquired by the method of trial and error. Dr. Norwood's advice, if applied, would save many from the worst blunders. Mr. J. H. B. ROUND (Westminster Hospital), in seconding, remarked that had Dr. Norwood been a medical man he would probably have been a thorn in the flesh of students, because he would have been one of those to whom medicine was common sense.

Mr. W. MCADAM ECCLES, chairman of the Students' Committee, repeated his usual advice to the newly qualified to carry out three necessary duties—namely, to register, to join a medical defence organization, and to become a member of the British Medical Association.

AIR RAID PRECAUTIONS

HOME OFFICE MEDICAL INSTRUCTION

The following is the first of a series of brief reviews of the work of the Home Office medical instructors to be issued by the Air Raid Precautions Department.

The scheme of training by medical instructors was inaugurated in September, 1936, with the appointment of ten fully qualified medical practitioners trained at the Civilian Anti-Gas School. It was apparent, shortly afterwards however, that for the instruction of the medical, dental, veterinary, and nursing professions throughout England, Scotland, and Wales this number was inadequate. Accordingly six further medical men, who likewise underwent a course of training at the Civilian Anti-Gas School, were appointed in December, 1936. The names of these sixteen instructors and the centres from which they operate are as follows:

Instructor	Centre
Surgeon Captain P. F. Woodruff Minett	Birmingham
Dr. R. J. Rankin	Cambridge
Dr. E. T. Glenny	Cardiff
Dr. J. N. Hay	Edinburgh
Dr. G. L. Pilkins	Glasgow
Dr. K. H. Beverley	Leeds
Dr. L. T. Challenor	Liverpool
Major General H. P. W. Burlow	London
Colonel G. S. Wallace	London
Dr. L. Haden Guest	London
Colonel J. Mackenzie	London
Dr. K. S. Dickinson	Newcastle upon Tyne
Flight Lieutenant T. A. G. Hudson	Nottingham
Dr. E. M. Pearse	Salisbury
Dr. P. J. Delahunty	Shrewsbury
Colonel H. R. Bateman	York

The total number of persons who have passed through the hands of these instructors up to the end of January is in the neighbourhood of 3,300 made up approximately of 1,600 doctors, 1,300 nurses, and 400 medical students. The majority of these medical practitioners have been reached through the British Medical Association, twenty of whose Branches have already received a completed course or courses of instruction, and another thirty or so are at present having such courses. In the county of London the results of this scheme amount to the instruction in anti-gas measures of a great number of doctors, of members of the nursing profession, and of medical students in some of the large teaching hospitals. In addition the members of many of the L.C.C. hospitals have attended courses.

In some cases where the trainees so desired, examinations have been held and all but a very small percentage have reached a qualifying standard, indicating the general enthusiasm with which this scheme has been met throughout the country. Medical instructors are faced with such an overwhelming demand for lectures that their programmes are booked up for many months ahead and almost the only difficulty encountered has been that of complying with demands soon enough to satisfy the enthusiasm of the applicants. This demand is growing by a natural and logical extension to the staffs of Government institutions such as Ministry of Pensions hospitals, mental hospitals, etc., and a careful policy of restriction to the primary purpose of instruction of the medical profession has to be pursued.

and exhibited the type of cellular reaction seen in the true silicotic nodule A third and large class of dusts were found to be "inert" their fate being slow dispersion accompanied by little cellular reaction that coal and talc should be found in this category is according to expectation but the inclusion in it of asbestos and sericite seems to call for some comment although the authors themselves make none Asbestos is certainly not inert in the lung nor according to the convictions of many is sericite Although this is a convenient method of assay it perhaps remains to be proved that the reaction of the peritoneum to dusts is always of the same nature as that of the lung Not only are these two tissues different in structure and function but there is also the difference that in Miller and Savers's method the experimental field must be bacteriologically sterile whereas infection may play a considerable part in modifying the silicotic process in the lungs

CRIMINAL ABORTION IN FRANCE

Criminal abortion is increasing in most countries but its increase causes particular anxiety in France where the birth rate is declining Dr Paul Balard[1] believes that there are as many criminal abortions in France as births As he points out abortion produced by wilful interference is much more dangerous than involuntary abortion for it is so often accompanied by serious haemorrhage and infection His own mortality figures are 3 5 per cent for criminal and 1 25 per cent for other abortions The only possible remedy in which he sees any hope is a change in the mentality of the age and the acceptance of a policy of reproduction Many unmarried women he remarks seek abortion because the father of the child refuses to accept any responsibility and many married women seek it because their husbands blame them for the pregnancy and regard it as a personal injury to themselves Nowadays it seems to him a child is looked upon not only as a responsibility but also as a nuisance and an impediment to a life of pleasure and distraction He sees in religious morality the only barrier against an individualism which has got out of hand meanwhile maternity must receive positive encouragement He would award the father a substantial allowance in respect of every child after the third If he argues fathers of families had more spending power the money would provide employment for others and would be better spent than if it were distributed as a dole He suggests that the police could easily compile a fairly complete list of all practising abortionists and could make these practitioners feel that they were being watched and that their calling was too risky to be worth while The existing law—if the police cared to use it—gives them ample power to prevent the sale of the bougies cannulae and drugs which are widely exposed for sale and are designed for nothing but criminal abortion If no woman were allowed to pursue the double calling of herbalist and midwife many recruits would be says be lost to the army of abortionists He admits that the measures he advocates are drastic but holds that they are necessary The paradox remains that France with its falling birth rate and desperate anxiety for the future size of its population has a social convention which is more savage in its condemnation of the unmarried mother than that of almost any other country Moreover economic conditions in France make marriage difficult for young persons and the legal and social sanctions which require the consent of the head of the family render it unattractive Human instincts and emotions have found outlet in a system of liaisons which have been universally tolerated as indispensable. This acceptance of the irregular union comes into urgent conflict with the legal prohibition—the result of anxiety at the falling birth rate—of the sale and use of contraceptives The inevitable outcome is an epidemic of criminal abortion France and other nations with the same problem cannot have it both ways If they want a large population they must encourage motherhood As it is a social disaster to encourage unmarried motherhood they must make early marriage easy and attractive The Italians seem to have gone some way towards solving the problem and the French might perhaps profit by their example

HEAT DISEASE

From observations made in the steel mills of Pennsylvania Heilman and Montgomery[1] have recently published a careful clinical and laboratory study of the pathological effects of heat All their cases appear to have fallen within one or other of the now well-recognized three clinical forms of heat disease—namely heat cramps heat exhaustion and heat hyperpyrexia to which they have given the name heat retention Heat cramps are usually abrupt and dramatic in onset For example a furnace gang is working before a huge blazing furnace having a temperature of 1 500° F The heater throws open the door and turns the pack he puts down his tongs falls doubled up and writhes in agony on the floor Recurring muscular twitches attended by pain begin Violent paroxysmal cramps of the muscles and trunk and extremities twist his body his face is flushed his pupils are dilated and his expression is that of excruciating pain and distress He complains of dizziness tinnitus and gastro intestinal cramps Vomiting is frequent and spasm of the respiratory muscles may interfere with breathing Patients with heat exhaustion have symptoms of faintness and collapse without cramps The picture is that of shock Patients in the heat-retention group show the pathognomonic manifestation of high temperature The temperature rises from three to ten degrees Occasionally the onset is abrupt and the subject may fall unconscious or die with startling suddenness More usually there are restlessness occipital headache vertigo and great excitement extreme drunkenness is often simulated In regard to heat cramps the authors confirm that the essential aetiological factors are dehydration and loss of salt The importance of replacing salt as well as water is now well recognized

INSURANCE MEDICAL SERVICE WEEK BY WEEK

The Nation's Medicine Bill

The cost of drugs supplied to insured persons on doctors' prescriptions in 1936 was £2,242,519, according to a statement published by the Ministry of Health. This represents an average payment of 3s. 2·3d. per insured person entitled to obtain medicines from insurance chemists. In 1935 the cost was £2,100,167, representing 3s. 1d. per insured person. As in previous years the average consumption of medicine per head of the insured population was much higher in England and Wales than in Scotland. In Scotland the cost of drugs in 1936 was £176,996, or 1s. 11·31d. per patient.

Numerous instances are recorded of exceptional quantities of medicines supplied to insured persons. These include twelve prescriptions issued to one patient at a total cost of £34 1s. 6d.; three prescriptions for oxygen issued by one practitioner to three patients at a total cost of £2 8s.; one prescription for an ovarian hormone preparation at a total cost of £5 12s. 4d.; and one prescription for anti-pneumococcal serum at a total cost of £10 5s. 5d. In one case an insured person had £136 worth of drugs during the year.

In a communication from the Ministry sent recently to the Insurance Acts Committee—to which body an examination of the problem of the heavy costs of prescribing has been referred by the Conference of Panel Committees—it is stated that:

> The continuous increase in the cost of prescribing for insured persons which has been noticeable during the past few years is causing concern to all engaged in the administration of medical benefit, and it is noted that public expression has been given by various bodies and persons to the suggestion that the efforts of the Department to control excessive prescribing should be supplemented by the help of other bodies. In particular the Chairman of the Insurance Acts Committee has publicly claimed that the profession itself, if given an opportunity, can help materially. It is in view of these expressions of opinion that the Department asks for the co-operation of the Insurance Acts Committee.
>
> The problem of the investigation of the rising costs of prescribing presents itself in two aspects—namely: (1) the differences observed between the prescribing costs of individual practitioners within an area; and (2) the wide differences between the average prescribing costs in different areas of the country.

After observing that the Department is sending more cases for investigation to the Panel Committee the statement sets out in tabular form the average number of prescriptions per insured person, the average cost in pence per prescription, and the average total cost in pence per insured person for the years 1930–5 (The figures for 1936 are given above.) The table shows that while the average cost per prescription rose from 7·95 pence to 8·06 pence (approximately 1·3 per cent.) the average number of prescriptions per insured person rose from 4·12 to 4·60 (approximately 11·6 per cent.). The rise in the average cost of prescriptions, the statement continues, "is probably to be wholly accounted for by the introduction in recent years and the increasing use of expensive but necessary preparations (liver extract, insulin, etc.). It is thus necessary to direct attention to the question of the number of prescriptions issued."

A further table showing variations between selected areas suggests that

> there are factors *under the control of the practitioners* which account for some of the variations in prescribing costs in different areas of the country. It is not apparent why Rochdale with 6·0 per cent. of insured persons treated annually should show 4·8 prescriptions per insured person while Salford with approximately the same proportion treated requires 7 prescriptions. Similar discrepancies reveal themselves between Blackburn and Bolton, Leeds and Wakefield, Birmingham and Wolverhampton.

Costs of Prescribing in Lancashire

The Lancashire Panel Committee has issued a memorandum in which it comments very fully on a report by the Lancashire Insurance Committee on costs of prescribing in Lancashire. The Panel Committee notices with surprise and concern that in May last the Minister of Health stated, in reply to a question in the House of Commons, that he had received a report from the Lancashire Insurance Committee to the effect that there was unnecessary prescribing by doctors in Lancashire. If the report referred to is the same which has been submitted to the Panel Committee the Minister has been misinformed or has answered the question without having personally studied the report. So far as the Panel Committee is aware the Lancashire Insurance Committee has expressed no such opinion. The Panel Committee points out that the following resolution was actually moved by Lancashire at the last Conference:

> That this Conference is of the opinion that the *National Formulary* for national health insurance purposes prepared by the Insurance Acts Committee and issued with the concurrence of the Ministry of Health is sufficiently comprehensive to cover the medicinal treatment of the majority of conditions with which the insurance practitioner has to deal and that a more general use of the *Formulary* would result in a considerable reduction in the cost of supplying insured persons with drugs without reducing the therapeutic efficiency of the treatment given.

The memorandum states that

> the Panel Committee recognizes that the total cost of supplying drugs to the insured population has increased steadily during the last twelve years not only in Lancashire but in *all parts of the kingdom*. The Committee is concerned at this increase and is anxious to take any part it can in preventing further increases and to bring about a reduction in cost if this can be done without at the same time reducing the therapeutic efficiency of the treatment given. The cost of supplying insured persons with drugs is determined by the product of two factors, frequency per insured person and cost per prescription.

With regard to the total cost per prescription it is pointed out in the memorandum that the cost in Lancashire was 8·16 pence in 1935 against 8·72 in 1923.

> There has been a uniform and very gradual reduction in the cost of each prescription not only in Lancashire but throughout the whole country with the exception of Birmingham which in 1923 had the lowest figure of all the big cities (7·40 increased in 1935 to 7·67). An appended table shows that the figure for Lancashire in 1935 is only 0·55 pence higher than Liverpool (the lowest of all the big cities). The average total cost per prescription has been remarkably uniform throughout the country for twelve years. Excluding Scotland the highest figure was Manchester 8·73 in 1923 and the lowest Liverpool 7·61 in 1935.

The dispensing fee, it is stated in the memorandum, is a fixed cost and is practically constant and is entirely outside the control of the doctor. The only factor therefore that is within the doctor's control is the ingredient cost. The Committee is confident that neither the Minister of Health nor the Insurance Committee would urge the doctors to reduce this to a lower figure than the present very low one.

Number of Prescriptions Issued to Each Patient

This will probably be found to be the crux of the problem. It is referred to in the Ministry's memorandum above and in the Lancashire memorandum it is observed that in Lancashire

A man doing heavy work at a high temperature may lose up to 20 grammes a day McCance in his Goulstonian Lectures,[1] emphasized the difficulty of meeting abnormal demands for salt on a normal diet Heilman and Montgomery advocate the liberal supply to workers of chilled saline water (0 1 to 0 2 per cent) In developed cases of heat cramps intravenous infusion of saline afforded almost immediate relief The most interesting finding in cases of heat exhaustion was a depleted blood sugar, which in the authors' patients averaged 64 3 mg per 100 c cm , a figure much below that found in their controls or in the other two heat syndromes Since the routine administration of gum-drops to operatives the cases of heat exhaustion per year fell from 326 to 67 The term "heat retention" appears truly descriptive in that it was found to be prone to occur in men who could not perspire normally When the external temperature exceeds that of the body loss of heat by radiation and conduction ceases and the regulation of body temperature depends solely upon convection and evaporation Poor perspirers must shun the Tropics, the steel mill and the stokehold Anhidrosis is uncommon and usually congenital, but Mogens Fog[2] has just recorded in detail an interesting case of complete loss of the capacity to sweat in a young man following upon an attack of paratyphoid fever

VITAMIN C IN MILK

Working at the National Institute of Research in Dairying, Kon and Watson[3] have explained some of the discrepancies in observations on the vitamin C content of milk Ascorbic acid is known to be an unstable substance readily oxidized to dehydro-ascorbic acid The oxidation product is not titratable with the indophenol reagent which is used for the estimation of vitamin C, but can readily be reconverted into ascorbic acid by reduction with hydrogen sulphide Kon and Watson find that ascorbic acid and dehydro-ascorbic acid are equally active biologically On the other hand dehydro ascorbic acid is unstable in milk as in aqueous solution it is steadily converted into a biologically inert form which cannot be reconverted to ascorbic acid This process is greatly accelerated in milk by exposure to sunlight or even to bright daylight After half an hour s exposure to bright daylight in an ordinary pint glass milk bottle practically the whole of the ascorbic acid is oxidized Part of it is still biologically active, but a large proportion is biologically inert, and the change to the inert form continues steadily, even in the dark Apparently there are more disadvantages in allowing milk to stand on the doorstep on an early summer Sunday morning than the mere risk of having it stolen The authors find that if milk is taken direct from the udder where ascorbic acid is all excreted in the reduced form and immediately pasteurized there is no loss of activity , but pasteurization even after a brief exposure to light rapidly changes dehydro-ascorbic acid into the inert form A pint of cow's milk straight from the udder may contain as much as 20 mg of ascorbic acid, and it is a pity that the greater part of this is being lost According to van Eekelen[4] and Heinemann an adult requires 60 mg a day and it is probable that suboptimal intakes are very common The destruction of ascorbic acid in milk under the influence of light is however so rapid that its preservation would require elaborate and expensive alterations in the methods of distribution Dairy milk can therefore not be relied upon as a source of vitamin C

PULMONARY INFARCTS

We have previously referred[5] to the work of Villaret, Justin-Besançon and Bardin who as the result of experiments, concluded that death following pulmonary embolism was due to a reflex phenomenon determined by the impact of fine particles on the nerve endings in the pulmonary arterial bed L Justin-Besançon J Delarue, and P Bardin now describe additional experiments in which embolic infarcts were produced, as before, by introducing porcelain "pearls" into the external jugular vein None of the animals died as a result of this procedure they were killed by intravenous injection of formalin or chloroform at different intervals up to thirty days after the introduction of the pearls, and the histological changes in the lungs were studied The authors dismiss the various theories of the formation of pulmonary infarcts they find that the infarct is not merely a simple interstitial haemorrhage since definite changes in the lung parenchyma were observed to precede and follow the haemorrhagic infiltration while others appeared to be independent of it These changes comprised early oedema, leucocytic diapedesis macrophagic metamorphosis, and cellular multiplication of the alveolar walls at the same time as the haemorrhagic invasion, and also haemorrhagic infiltration of the walls of vessels in the region of the infarct and bronchial lesions They conclude that a pulmonary infarct should be regarded as an acute exudative and haemorrhagic inflammation brought about by sudden local disturbance of the neuro-vegetative and vasomotor equilibrium of the lung

The late Sir Austen Chamberlain was chairman of the Court of Governors of the London School of Hygiene and Tropical Medicine and chairman of the Governing Body of the British Post-Graduate Medical School and took a deep personal interest in the work of both institutions

We would again remind members of the British Medical Association of the arrangements made for the visit to Belfast of a liner, the s s *Almanzora* providing accommodation for 450 people attending the Annual Meeting in July next Particulars will be found in our *Supplement* this week To ensure that these arrangements are carried into effect bookings should be made without delay

the frequency per insured person has increased from 3·87 in 1923 to 5·05 in 1935. This latest figure is only 0·2 higher than London (the lowest of the areas mentioned in the appendix) and is 1·40 lower than Manchester (the highest). London is the only big city with a lower frequency figure than Lancashire County. A table which is appended shows that this ratio is remarkably uniform in all big cities and in Wales and Scotland. More remarkable still the increase is in almost the exact ratio as the figure recently prepared from statistics collected from all over the country and compiled by the Insurance Acts Committee showing that in 1923 each insured person received on an average 3·75 attendances (visits or consultations), and that in 1935 this figure had risen to 5·11."

The Lancashire Panel Committee concludes

that the increase in frequency is due entirely to the altered habit of the insured population and to the increased amount of work done by the doctors. Recent health propaganda has caused the insured person to become health conscious and often disease conscious. He takes more notice of slight ailments, and consults his doctor earlier and more frequently. Gradually the insured population is becoming composed of persons who never at any time have paid private fees for medical attendance, whereas the original insured population had already acquired an economic habit in this respect. It is likely, therefore, that the frequency factor has not yet reached the peak and will not do so until the entire insured population consists of persons who have never received medical attention in any other way. The frequency factor is almost entirely outside the control of the doctors.

Ophthalmic Treatment and Form G P 45

A correspondent (see column opposite) raises the question whether it is really necessary to fill up Form G P 45 where a specialist service in the form of ophthalmic treatment is paid for by the insured person's approved society either wholly or in part. It has already been stated in these notes that the ordinary procedure must be observed in such a case—that is, when the insurance practitioner performs an operation or gives treatment which is in his opinion a specialist service the Insurance Committee must be notified on Form G P 45. It will be appreciated that the sole question which arises is whether or not the service falls within the practitioner's contract.

It has also been noted in this column that in some areas where the same specialist service is repeatedly rendered by an insurance practitioner, and it has once been determined by agreement between the Insurance Committee and the Panel Committee that a specialist fee may be properly charged, there is no necessity to keep going through the routine of reference to the Panel Committee. Our correspondent would be on surer ground if he were to suggest that in repeated cases of the same service or operation the practitioner might be permitted to send a much simplified form of notification to the Insurance Committee after the first notice on Form G P 45.

Vaccination at the Request of an Employer

The same correspondent refers to the question of charging a fee where he is asked to vaccinate a patient at the request of her employers. If this doctor will turn up the very full index in the new edition to *Medical Insurance Practice* he will find the following entry: 'Vaccination—as routine requirement by employer, page 65.' And at page 65 he will find that he would be justified in charging a fee where the insured person asks to be vaccinated solely in order to satisfy the routine requirements of an employer. As stated a little earlier in the same chapter it is for the practitioner to decide in the first instance whether any particular form of treatment preventive or otherwise is in the interests of the patient's health, but in general he would be expected to give the same treatment that he would advise one of his private patients to undergo in similar circumstances.

THE CAPITATION FEE

DEPUTATION TO MINISTRY OF HEALTH

Sir Kingsley Wood, Minister of Health, who was accompanied by Mr. Scrymgeour Wedderburn, Parliamentary Under Secretary for Scotland, on March 11 received a deputation from the British Medical Association. Dr. Guy Dain spoke on behalf of the deputation, who urged that the fees paid to medical practitioners under the national health insurance scheme should be increased, and that the fee should apply not only to the present insured persons but also to the juvenile workers for whom the Government had announced their intention of providing medical benefit. The deputation suggested that, as on former occasions, the matter should be referred to arbitration.

Sir Kingsley Wood said that he considered that a flat rate substantially below the present figure could well be justified, and he agreed that the question should be determined by arbitration, which should take place as soon as possible.

Correspondence

THE INSURANCE MEDICAL SERVICE

SIR,—My attention has just been drawn to a note in the *Supplement* of January 23 (p. 44) on ophthalmic treatment. Many of my own insured patients who go to the National Eye Service come back to me for examination under the National Ophthalmic Treatment Board scheme. In this case the fee is of course partly or wholly paid by the approved society, but surely there is no suggestion that Form G P 45 should be filled up in all these cases?

Recently a patient came to me with a note from her employers requesting me to vaccinate her and stating that they would readily pay my fee. I explained to her that I could accept no fee, and that I did not feel justified in putting the Drug Fund to the expense involved merely at the desire of a third party. I therefore sent her to a friend of mine who vaccinated her and sent in an account for his fee! All very silly!—I am, etc.

London, N.8, March 2. A. ERNEST SAWDAY.

AN ELDERLY PRACTITIONER AND NIGHT VISITS

SIR,—In commenting on this case (*Supplement*, March 6, p. 115) you say: 'The case is of interest mainly as a reminder that a duty rests upon any insurance practitioner who feels unable to undertake night visits to have a standing arrangement with a deputy who is readily available.' To me, and I feel sure to all who ponder, the main interest lies in another and more important aspect.

Without wasting time in setting forth my reflections and reasons let me at once say that the circumstances of this case point to an almost imperative demand for some adjustment of the Terms of Service for men who are elderly. In no other public service is there such a flat rate consideration of the essential workers. All panel doctors by the public and by the national health insurance authorities are looked on simply as registered medical practitioners irrespective of what their academic professional or other attainments may be, whether they be young recently qualified men, or men ripened by years of experience and mellowed by a rich knowledge of men and medicine. The sooner the better administrators and legislators realize that all men—especially medical men—are not alike and equal because forsooth their names appear on the panel list.

If the best is to be obtained from the national health insurance medical service there should be established grades of seniority such as obtain in other services wherein the more senior servants enjoy certain privileges which the juniors have yet to earn. For my part all my sympathies go out to the elderly gentleman who merely tried to exercise for his own poor ageing body that care—no more no less—he would have tried to bestow on any of his fellow men similarly situated. Good luck to him—I am, etc.

Llandilo, March 10. J. H. LLOYD.

ENDOCRINES IN THEORY AND PRACTICE

HORMONE DEFICIENCIES IN THE MALE

BY

KENNETH M WALKER, F R C S.

The Male Hormone

The testicle was the first organ in the body in which the existence of an internal secretion was demonstrated Bertholdt's transplantation studies in the capon, as long ago as 1849, might indeed be considered the pioneer experiments in endocrinology In spite of this early start it is only within the last few years that the testicular hormone has actually been isolated That this should have happened long after other organs of internal secretion have yielded their active principle to the biochemists methods of extraction is due in great part to the fact that, whereas such glands as the thyroid store large amounts of hormone in concentrated form, the quantity of internal secretion within the testis at any given moment is very small F C Koch has estimated that to obtain one capon dose of testicular hormone anything from 50 to 100 grammes of testicular tissue are required Yet in human therapy the amount of effect produced by one capon dose is negligible and it would be necessary in order to produce an effect to measure the amount of secretion given not in capon doses but in milligrammes of pure secretion When it is realized that according to Koch a whole ton of bull's testicle contains only 100 to 150 milligrammes of pure hormone it will not seem surprising that the therapy of the testis lags woefully behind that of the thyroid

To Butenandt must be given the credit of first having isolated in pure crystalline form the male sex hormone This he achieved in 1931 not, as others had attempted, from the testicle itself but from human urine, obtaining 15 milligrammes of a substance he called androsterone from 25 litres of urine Eventually sufficient of this pure product was extracted to permit of analysis, it yielded the formula $C_{19}H_{30}O$ Later E Laqueur and his associates succeeded in isolating the hormone from the testis itself (testosterone), and Ruzicka, in preparing what was apparently an identical substance from cholesterol (androsterone and dehydro-androsterone)

The chemistry of these various products is still debated, as is also the question whether the testis may not form more than one hormone Moore writing last year, says that, in spite of the fact that different methods of extraction yield what is apparently the same product, there are reasons for believing that the testis secretes more than one active principle Should this turn out to be the case it may explain the confusion that has long existed on the subject of the source of the internal secretion of the testis Of late years Ancel and Bouin's conclusions that the interstitial cells of Leydig were alone responsible for the formation of internal secretion have been widely criticized, many authorities believing that the cells of the seminiferous tubules furnish an internal as well as an external secretion This subject although of great interest, is however, outside the scope of a paper that aims only at giving a general survey of male hormone therapy

Of the male hormone deficiencies with which medical men may be called upon to deal the commonest are the various deficiencies that are grouped under the heading of eunuchoidism, arrest of the normal descent of the testis (undescended testicle), and failures in spermatogenesis (azoospermia oligozoospermia and necrozoospermia) These conditions will now be considered

Eunuchoidism

From the outset it must be confessed that attempts to treat eunuchoidism either by the administration of hormones or by means of testicular grafts have met with but little success This is due partly to the fact that in the majority of cases eunuchoidism is not a pure condition but is associated with deficiencies in other members of the endocrine circle, and especially in the pituitary Its treatment therefore calls for multiple organotherapy and for the administration of active principles which we do not at present possess in sufficient quantity for the purposes of medicine It is also explained by the practical difficulty of obtaining enough testicular hormone to exert a therapeutic action on the human body Professor Koch once confided to the writer that with all the abattoirs of Chicago at his disposal he could only obtain enough male hormone for laboratory experiments and that he saw little hope of sufficient quantities ever being available for human therapeutics Since this remark was made other sources of male hormone have been discovered but unfortunately all the methods of extraction are so expensive that many years are likely to pass before testicular hormone therapy becomes practicable It is probable that when eventually this is the case the source of supply will be from sterol by means of synthetic degradation methods

In the meantime various commercial preparations labelled testicular extract will be administered by the medical profession to their patients in a spirit of optimism that may sometimes help the patients psychologically and can certainly never harm them Even when the brand of male hormone selected for injection contains the active principle of the testicle the amount given is so small as to exert no appreciable influence on the body But as often as not the testicular extract, as well as being inert is administered orally, by which route at least ten times as much hormone would be required in order to produce an effect

Undescended Testicle

Of the hormonic treatment of undescended testis it is possible to speak with greater optimism The experimental work of Evans, Smith, Engel, Aschheim and many others has shown that a gonad stimulating principle is present in the anterior lobe of the pituitary, controlling the activities of the ovaries and testis Other experiments suggest that this principle is twofold one acting chiefly on the germ cell and the other on the thecal cells of the ovaries and the interstitial cells of the testis Aschheim and Zondek's subsequent discovery that a gonadotropic hormone similar in action to that produced by the pituitar could be extracted from pregnancy urine has much facilitated work on this subject By providing a source from which gonadotropic hormone can with less difficulty be obtained they have indeed brought what was previously

PARKING OF DOCTORS CARS

SIR—The letter of Dr Dahne in the *Supplement* of March 13 (p 132) with reference to the parking of cars is none too timely I heartily endorse his sentiments for to my mind it is a far more serious question than the speed limit There are numerous occasions when one has to leave the car outside a patient's house albeit in a busy thoroughfare for an hour or so while on a serious case It is difficult to imagine anything more harassing than the thought that a policeman may at any moment during a midwifery case knock at the door and ask a lot of questions and demand that the car be taken elsewhere perhaps five or ten minutes journey away to a garage And is it not possible that while the chauffeur is having lunch and the car is outside the surgery an emergency call may come through and the doctor have to leave immediately and drive himself? What then if the car is in the garage perhaps five or ten minutes walk away? Can one allow a patient with say coronary thrombosis to wait half an hour before relieving his pain if heavenly intervention has not already done so?

The Minister of Transport stated in the House of Commons that the question of whether and for how long leaving a car on a public highway not appointed as a parking place constitutes an obstruction is under long established law to be determined with reference to the particular circumstances of each individual case and there is no proposal to amend the general law in this matter Nobody has the time to go to court and argue the particular case with a magistrate The police in a given district usually know the doctors cars fairly well but they have their duty to perform and unless they are given instructions in this matter I am afraid there will soon be a glut of prosecutions for parking so far as doctors are concerned I feel that at least in this matter the B M A should immediately take steps to secure exemption for medical men when on duty On the question of special badges for doctors cars I feel that this is not essential but your addendum to Dr Dahne's letter is evading the issue—I am etc,

London E 1 March 15 PHILIP KAPLIN

SIR—Your correspondent (*Supplement* March 13 p 132) who raises the question of the parking of doctors cars may be interested to know that some three months ago I was fined a guinea at Bow Street for leaving my car outside St Paul's Hospital Endell Street while doing out patients there I should be glad to know of any other cases of summonses against medical men who have left their cars while giving their services to hospitals—I am etc

The Central Association for Mental Welfare has arranged a course for persons engaged in the training of mental defectives in occupation centres institutions or mental hospitals and for home teachers to be held in London from July 5 to 24 During the same period there will be a course for officers of local authorities and local associations for mental welfare engaged in the ascertainment and supervision of defectives Particulars of both courses may be obtained from the secretary Central Association for Mental Welfare 24 Buckingham Palace Road S W 1

The twelfth session of the General Council of the Association Professionnelle Internationale des Medecins will be held in Paris from July 8 to 11 with Dr Haedenkamp in the chair

an interesting scientific observation within the realms of practical therapy Engel in 1932 led the way by proving that injections of extracts of anterior pituitary or of pregnancy urine into immature monkeys brought about the descent of the testis into the scrotum by the fourteenth day Since then a large number of writers have published the results of this treatment in human beings In a paper appearing in the *Lancet* of last year A W Spence and E F Scowen recorded the results of treating thirty-three patients suffering from imperfectly descended testis with 500 rat units of pregnyl twice weekly In eleven out of the nineteen unilateral cases the testis descended, and in six of the bilateral cases both testes reached the scrotum in four only one did so E McLellan later published similar results, and at the same time commented on the type of case that was more likely to respond to hormonic treatment His conclusions were that hormonic therapy had a better chance where the undescended testicle was small and undeveloped, but that when the testicle approximated to the normal orchidopexy was the treatment of choice

Treatment of Aspermatogenesis

Laboratory work on the gonadotropic hormone of the anterior pituitary strongly suggests that these consist of two factors one of these, prolan A, in the female brings about maturation of the Graafian follicle and the production of oestrin, the other, prolan B converts the follicles into the corpora lutea, inhibits the production of oestrin, and stimulates that of progestin In the male prolan A acts on the tubules and stimulates spermatogenesis, whilst prolan B works on the interstitial tissue of the testis, causing it to hypertrophy Pregnancy urine, from which gonadotropic hormone for clinical purposes is usually obtained (pregnyl), contains much larger quantities of prolan B than of prolan A Consequently the action of pregnyl on the development and descent of the testis is far more marked than any action on its tubules Indeed it is controversial whether pregnancy urine extracts have any effect on spermatogenesis, and it is quite likely that we may have to wait until sufficient quantities of prolan A can be obtained from animal pituitary glands before we can hope to influence materially cases of aspermatogenesis This at any rate is the lesson to be derived from experiments in hypophysectomized animals, in the case of which anterior pituitary extracts have proved far more effective than urinary extracts in re-establishing the activity of the tubules In the meantime we are compelled to treat these cases with the extracts that are at present available In this connexion it should be remembered that some cases of male sterility are due not to a deficiency of prolan A but of thyroid These will rapidly respond to the use of small doses of that gland

Endocrine Therapy in Prostatic Enlargement

Recently attention has been directed once again to the question of the relations of the male hormone to enlargement of the prostate and attempts are being made to treat this condition by testicular extracts This therapy is based on the assumption that enlargement is the result of a disturbance in the normal balance existing between the secretions of the testis and those of the pituitary Nichans in the endocrinological survey preceding his paper on the treatment of prostatic enlargement by operation Steinach II has gone so far as to state categorically that enlargement of the prostate is due to a preponderance of the internal secretion of the Leydig's cells over that of the cells of Sertoli, with secondary reactions on the pituitary, and that if the balance between these secretions can be restored the prostate shrinks On the shifting foundations of as yet unconfirmed experiments he has built up a complicated structure in order to support his practical findings, that ligature operation brings about a shrinkage of the enlarged prostate Unfortunately our present endocrinological knowledge is so limited that logical arguments for or against Nichans's operation have little value Not only is the pathology of prostatic enlargement itself a matter of doubt but the endocrinological foundations on which he builds cannot support the weight he places on them

The only recent positive finding on the subject of the pathology of prostatic enlargement on which we can put reliance is Lacassagne's observation that if oestrin be injected into mice certain changes occur in the prostate These changes consist of the conversion of the single layer of cells lining the prostatic tubules into stratified epithelium and distension of the alveoli by masses of keratin These modifications in the prostate are often followed by retention of urine, hydronephrosis and suppuration in the contents of the distended prostate H Burrows and N M Kennaway have noted the same phenomena after applying oestrin to the skin of mice, and Parkes and Zuckerman proved that similar changes may be produced in the prostates of monkeys Laqueur has thrown further light on the subject by showing that these changes are more likely to occur in the absence of male hormone, being more readily produced in young castrated mice and rats He has also shown that mice can be protected from the increase in size of the prostate by simultaneous injections of male hormone He therefore suggests that in prostatic enlargement there exists an improper balance between the male and oestrogenic hormones in the body Acting on this suggestion he and a number of other investigators have attempted to treat enlargement in human beings by means of repeated injections of male hormone Laqueur himself reports favourably on 133 cases so treated, but other workers have obtained less definite results

At the present moment this matter is being investigated under the auspices of the Medical Research Council These experiments are still in progress, and it would be rash on the part of one who is engaged in this work to foretell the future I cannot, however, avoid expressing the opinion that when the results of these experiments are eventually published they will not reveal that any dramatic step forward has been taken in the hormonic treatment of prostatic enlargement

Proposed Alteration of Areas of Brighton, Eastbourne, and Hastings Divisions

Notice is hereby given by the Council of the Association to all concerned of the following proposed alterations of areas of the Brighton, Eastbourne, and Hastings Divisions of the Sussex Branch, which have been approved by the Branch and Divisions concerned

Brighton Division (i) To cede to Eastbourne Division that part of Hailsham R D which is within the area of Brighton Division and (ii) to receive from Eastbourne Division that part of Uckfield R D which is within the area of that Division

Eastbourne Division (i) To cede to Hastings Division that part of Battle R D which is within the area of Eastbourne Division, (ii) to cede to Brighton Division that part of Uckfield R D which is within the area of Eastbourne Division and (iii) to receive from Brighton Division that part of Hailsham R D which is within the area of that Division

Hastings Division To receive from Eastbourne Division that part of Battle R D which is within the area of that Division

Any member affected by these proposals and objecting thereto is requested to write to the Medical Secretary by April 20, stating the objection and the ground therefor

G C ANDERSON,
Medical Secretary

March 20 1937

Sir Charles Hastings Clinical Prize

The Sir Charles Hastings Clinical Prize, which consists of a certificate and a money award of fifty guineas, is again open for competition in respect of 1938 The following are the regulations governing the award

1 The Prize is established by the Council of the British Medical Association for the promotion of systematic observation research and record in general practice, it includes a money award of the value of fifty guineas

2 Any member of the Association who is engaged in general practice is eligible to compete for the Prize

3 The work submitted must include personal observations and experiences collected by the candidate in general practice and a high order of excellence will be required If no essay entered is of sufficient merit no award will be made It is to be noted that candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject though reference to current literature should not therefore be omitted when it bears directly on their results their interpretations and their conclusions

4 Essays of whatever form the candidate desires his work to take, must be sent to the British Medical Association House, Tavistock Square London W C 1 not later than December 31 1937 The Prize will be awarded at the Annual General Meeting of the Association to be held in July 1938

5 No study or essay that has been published in the medical press or elsewhere will be considered eligible for the Prize and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work A prizewinner in any year is not eligible for a second award of the Prize

6 If any question arises in reference to the eligibility of the candidate, or the admissibility of his or her essay the decision of the Council on any such point shall be final

7 Each essay must be typewritten or printed must be distinguished by a motto and must be accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address

8 The writer of the essay to whom the Prize is awarded may, on the initiative of the Science Committee be requested to prepare a paper on the subject for publication in the *British Medical Journal* or for presentation to the appropriate Section of the Annual Meeting of the Association

9 Inquiries relative to the Prize should be addressed to the Medical Secretary

Branch and Division Meetings to be Held

BATH BRISTOL AND SOMERSET BRANCH WEST SOMERSET DIVISION—At Taunton and Somerset Hospital, Tuesday March 23 3 30 p m Dr C MacGaffey Recent Views on Renal Disease"

BERKS BUCKS AND OXFORD BRANCH OXFORD DIVISION—At Magdalen College, Oxford Wednesday, March 24, 8 30 p m Sir Humphry Rolleston Medical Oxford More than Fifty Years Ago Preceded by dinner

KENT BRANCH BROMLEY DIVISION—Joint meeting with the Beckenham Medical Society at Railway Hotel Beckenham Thursday, March 25 8 45 p m Dr A C Hampson Dyspepsia Preceded by supper at 7 45 p m

LANCASHIRE AND CHESHIRE BRANCH BLACKBURN DIVISION—At Old Bull Hotel, Blackburn, Tuesday, March 23, 8 45 p m Dr L T Challenor, Medical Instructor for the Liverpool Centre under the Air Raid Precautions Department of the Home Office "Air Raid Precautions

LANCASHIRE AND CHESHIRE BRANCH WARRINGTON DIVISION—At Warrington Town Hall Wednesday, March 24 4 p m The first of a series of eight lectures on air raid precautions by Dr L T Challenor, Medical Instructor for the Liverpool Centre under the Air Raid Precautions Department of the Home Office

LINCOLNSHIRE BRANCH KESTEVEN DIVISION—Tuesday, March 23 3 15 p m Dr A Macrae (Assistant Medical Secretary) Some Problems in Intraprofessional Relations"

LINCOLNSHIRE BRANCH LINCOLN DIVISION—Thursday, March 25 Second annual dinner

METROPOLITAN COUNTIES BRANCH CHELSEA DIVISION—At Princess Beatrice Hospital Earl's Court, S W, Thursday, March 25 8 30 p m Dr S D Mitchell "Child Guidance from the General Practitioner's Point of View" Preceded by a cinematographic demonstration of the production of antitoxins, prophylactics and vaccine lymph

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—At Catford Town Hall Tuesday, March 23, 8 45 p m Dr H M M Woodward "Venereal Disease"

METROPOLITAN COUNTIES BRANCH WESTMINSTER AND HOLBORN DIVISION—At Florence Restaurant Rupert Street W Thursday April 22 8 p m Annual general meeting, to be followed by dinner Discussion "Useful New Drugs" To be opened by Dr Phillip Hamill

NORTH OF ENGLAND BRANCH GATESHEAD DIVISION—At Whinney House, Tuesday, April 20 Clinical evening

YORKSHIRE BRANCH BRADFORD DIVISION—Wednesday, March 24 Miss E Catherine Lewis "Some Aspects of Urology in Women

YORKSHIRE BRANCH GOOLE AND SELBY DIVISION—At North Eastern Hotel Goole Tuesday, March 23 8 30 p m Agenda Contract rates for attendance upon juvenile members of friendly societies, consideration of adoption of resolutions under ethical rules of Division, election of representative in Representative Body, paper by Dr J T Ingram (Leeds) Treatment of Common Skin Diseases" Preceded by supper at 7 45 p m

YORKSHIRE BRANCH SCARBOROUGH DIVISION—At Scarborough Hospital, Thursday March 25 8 30 p m Clinical meeting

YORKSHIRE BRANCH SHEFFIELD DIVISION—At Royal Victoria Hotel Sheffield Wednesday March 24 1 15 p m Luncheon to recently qualified medical practitioners

DIPHTHERIA IMMUNISATION

A.P.T. Evans
(Alum Precipitated Toxoid)

For children up to 8 years

Dosage Either a single injection of 1 cc or 0·1 cc (to produce the primary stimulus) followed by 0·1 cc–0·5 cc about four weeks later

T.A.F. Evans
(Toxoid Antitoxin Floccules)

For older children and adults

Dosage 1 cc at intervals of one to two weeks Three injections are necessary

F.T. Evans
(Formol Toxoid)

Used chiefly for children up to 8 years

Dosage 0·5 cc followed by two further doses of 1 cc each at intervals of one to two weeks

T.A.M. Evans
(Toxoid Antitoxin Mixture)

Is considered to have less liability to reactions than F T

Dosage as for F T

Comprehensive literature will be sent on request

Prepared at Evans' Biological Institute
by

Evans Sons Lescher & Webb Ltd.

LIVERPOOL and LONDON

"LIQ. SANTAL FLAV. c. BUCHU ET CUBEBÆ"

(HEWLETT'S).

THE ORIGINAL PREPARATION

"Experience has shown this preparation to possess the same efficacy as Santal Oil itself. It mixes perfectly with water, and has a taste by no means disagreeable, in which particular it contrasts very favourably with the ordinary mixture it is intended to replace."—PRACTITIONER

Packed for dispensing only, in 5, 10, 22, 40, and 90-oz Bottles

INTRODUCED AND PREPARED ONLY BY

THE BELFAST MEETING

HOTEL AND LODGING ACCOMMODATION

The facilities for housing the members who contemplate visiting Belfast for the Annual Meeting next July has given the local committee a considerable amount of anxiety, but it is anticipated that those available will meet the requirements of all visitors A list of suitable hotels was published in the *Supplement* of February 20 (p 95) The booking of *hotel accommodation* has been placed exclusively in the hands of Messrs Thos Cook and Son, and if applications are made at their office, 27 Royal Avenue, Belfast they will allocate rooms in order of application No booking fee is charged but a small deposit will be asked for on reservation being made, the deposit will be credited when the account is settled or returned if it is found that the room is not required

A register of *lodgings* is in course of preparation and various students hostels also are available Booking of these will be arranged through the Local Executive Office, and applications for hostel or boarding house accommodation should be addressed to the Secretary B M A, Whitla Medical Institute, College Square N Belfast

A number of residents have offered *private hospitality* and this will also be available Those members desirous of utilizing this should also apply to the secretary at the above address

ACCOMMODATION AND CRUISE ON S S "ALMANZORA"

To supplement the limited accommodation in an attractive manner arrangements have been made with the approval of the Council of the Association for provision of accommodation on board the s s *Almanzora* During the period of the meeting the liner will be moored in order that members may take a full part in all the social and scientific activities Moreover the mooring berth will be adjacent to a tram service which will take members to the city centre in ten to fifteen minutes At the close of the meeting the liner will leave Belfast and, proceeding via the Inner and Outer Hebrides and Scapa Flow will cruise in the Norwegian Fjords visiting Trondhjem, Merok, Hellesylt, Oie, and other places of interest The liner will return to Southampton on August 3 This cruise has been planned by Pickfords Travel Service in conjunction with the Royal Mail Lines and members of the Association who propose to attend the Belfast meeting and are interested in these arrangements are asked to make an early application to Messrs Pickfords at 205 and 206 High Holborn, W C 1, or at any of their branches

Meetings of Branches and Divisions

BOMBAY BRANCH

At a meeting of the Bombay Branch held at the Grant Medical College Bombay, on February 16 the honorary secretary Dr B B YODH explained the reasons for the visit of the Medical Secretary, Dr G C Anderson to India

The suggestions of the Branch Council for the improvement of the Branch were placed before the meeting and were approved They were (1) To form Divisions in each place in the Branch area where there were more than ten members These members would elect their own officers and for administrative purposes would be under the Bombay Branch (2) To enlist new members by circularizing medical practitioners twice a year pointing out the advantages of membership (3) To call more frequent meetings at least *once a month* Lieut. Colonel S L Bhatia's suggestion that an annual programme be prepared beforehand and circulated to the members was approved (4) To appoint a part time clerk if required by an increase in the correspondence

The HONORARY SECRETARY then put forward the suggestions of the Branch Council regarding the agenda of the representative meeting to be held in Bombay on March 4 and 5 Major S K Engineer and Dr B B Yodh were unanimously elected representatives of the Bombay Branch to the Representative Meeting Major ENJINEER then read a letter from the Overseas League Bombay Branch asking for previous intimation regarding representatives or delegates attending the Annual Meeting of the British Medical Association at Belfast Dr YODH informed the members that Lieut Colonel S S Vazifdar I M S had expressed a desire to attend the annual meeting as representative of the Branch and this was agreed

BURMA BRANCH

At the annual general meeting of the Burma Branch held at Rangoon on January 29 the following officers were elected for 1937

President Dr J S Lamie *Vice President* Lieut Colonel R H Malone I M S *Honorary Secretary and Treasurer* Dr J W Lusk *Representative in Representative Body* Lieut Colonel E Cotter I M S

Lieut Colonel H Aung Khin, I M S and Dr A D Broatch were elected delegates and the annual report was approved Dr N J Patterson was thanked for his report as representative in 1936 The meeting considered a letter from Captain G R M Apsey no one had heard of an international scale of fees for insurance examination but the meeting considered that a fee of Rs 16 or £1 1s was a proper amount whatever the amount of the assurance

CEYLON BRANCH

At a meeting of the Ceylon Branch held at Colombo on September 16 1936 with Dr V GABRIEL in the chair a Kodak film on some aspects of tuberculosis and its prevention and a film on appendicectomy by Dr M V P PEIRIS were shown Dr CYRIL F FERNANDO read notes on a case of complete heart block with Stokes Adams syndrome in an infant Dr C C DE SILVA read an instructive paper on oxycephaly and demonstrated a case and Dr H C P GUNEWARDENE a summary of his paper on tetanus

Dr BLAZE presided at a meeting of the Branch on October 14 1936 when Dr S E FERNANDO read notes on a case of intra orbital malignant endothelioma of the right eye removed by Dr Arndt The operation was in 1934 and there were no signs of recurrence Dr CYRIL F FERNANDO demonstrated three interesting cases of mediastinal tumours with x ray pictures of the chest Dr S L NAVARATNAM showed a case of congenital cleft sternum and Professor MILROY PAUL read a paper on accessory spleens illustrated by x ray films and microscopical specimens

At a special general meeting on November 6 1936 with Dr N ATTYGALLE in the chair it was decided to forward a copy of a resolution regarding immigration into Ceylon to the Commissioner of Immigration Further discussion took place on the professional relations between registered medical practitioners and Ayurvedic practitioners A meeting on November 18 1936 with Dr BLAZE in the chair was devoted to a paper by Dr H O GUNEWARDENE on Cardio vascular Autonomic Dystonia

The annual general meeting of the Branch was held on December 16 1936 with Dr BLAZE in the chair The report of council for the year was read and approved as was the statement of accounts The following officers were elected for 1937-8

President Dr Attygalle *President elect* Dr J H F Jayasuriya *Vice Presidents* Dr G S Sinnatamby and Dr G A Wickramasuriya *Honorary Secretary and Treasurer* Dr E M Wijeratna *Honorary Auditor* Dr S Muttiah

EAST YORKSHIRE BRANCH

The annual dinner of the East Yorkshire Branch was held at Hull on March 10 when the president Dr S F FOURACRE was in the chair and sixty one members and guests were present The toast of The British Medical Association was proposed by Mr J E RYALL Chief Constable of the East Riding Constabulary Dr FOURACRE replying The guest of the evening was Mr Norman C Lake whose health was proposed by Mr C H CORBETT Dr JOHN MORRISON proposed The Visitors and Colonel H R BATEMAN *D S O* the lecturer in the air raid precautions courses now being held in Hull and district replied The speeches were of a high standard and the evening was voted a great success

EGYPTIAN BRANCH

A meeting of the Egyptian Branch was held at Kasr el Aini on March 2 when Professor G VON ANREP gave an interesting account of some recent advances in physiology and dealt with the *action of specific metabolites in health and disease* referring to discoveries made in connexion with acetylcholine adenasine and histamine Dr ROLAND WILSON who presided thanked Professor Anrep for a very interesting lecture and congratulated the Branch on having so distinguished and capable a lecturer to address them

for so long on their backs that their cardiac efficiency was decreased But children with congenital dislocation of the hip kept in the position he had mentioned experienced no cardiac inefficiency Many of the cases were treated on the Bradford frame—a steel tubular oblong the shape of the bedstead He had designed a framework in which a Bradford frame was suspended on pulleys so that certain turning movements in different directions were possible One important point was that children who were *continually recumbent often did not get sufficient fluids and* became more and more constipated The cases also called for attention from the psychological point of view Much might be done by attention to the surfaces on which their eyes were generally resting and by some arrangement of mirrors life might be made more interesting for them The device of prismatic spectacles whereby it was made possible to read in bed with the book held in a natural position was a great boon

Mr F McG LOUGHNANE did not think that the decubitus position had very much to do with the formation of stone in the kidney Much had been heard about dehydration and sunlight leading to the formation of stone, but in Mesopotamia during the war where there was plenty of sun and everybody was being dehydrated, he came across only two cases of urinary calculus in four years He was very sceptical also about renal calculus disappearing on the resumption of an upright position

Mr GIRDLESTONE said that he did not think much of the ingenious theory of disuse atrophy which had been put forward The amount of calcium which passed into the blood stream from bone in any one day must be extremely small

EXTRACTS OF LIVER AND YEAST IN MACROCYTIC ANAEMIA

At a meeting of the Section of Therapeutics and Pharmacology of the Royal Society of Medicine on March 9 Dr DOROTHY HARE presiding Dr LUCY WILLS read a *paper on extracts of liver and yeast and their varying* efficiency in the treatment of macrocytic anaemia

Dr Wills reviewed the *differences* between pernicious anaemia and tropical macrocytic anaemia and pointed out the similarity between the latter and the nutritional anaemia of *rhesus* monkeys To investigate the haemopoietic activity of various liver and yeast preparations anaemic monkeys were used as test animals and control experiments were arranged on cases of pernicious anaemia Crude extracts of liver and yeast were active in both conditions, those from yeast in the case of pernicious anaemia only if given with normal gastric juice The use of more highly purified extracts of both substances resulted in the separation of two factors, one insoluble and one soluble in ammonium sulphate, the former was active in pernicious anaemia and inactive in the monkey anaemia, and the latter was active in the animal condition and had not yet been tested on cases of pernicious anaemia In addition to the animal anaemia certain monkeys which gave a good reticulocyte response when treated with purified extracts showed signs of a vitamin B_1 deficiency conditioned possibly by the *increased metabolism* associated with the reticulocytosis

The author exhibited graphs showing the effect on monkeys first of anahaemin (Dakin and West's highly purified liver fraction) and then of campolon The former in monkeys was negative the latter—in monkeys as in man—was frequently life saving The work suggested that there were at least two haemopoietic factors in all extracts It was only when the principles concerned were obtained in their pure form that their different actions became clear The very marked improvement in the animals when crude extracts were given was significant As in human beings long before the blood improved there was improvement in the clinical condition of the animal and one expected it to get better The clinical improvement was less marked with the use of the more purified extracts It seemed, therefore, that until the treatment of the tropical condition had been clarified it was well to use the cruder extracts and the same might be true in certain cases of pernicious anaemia A trial of anahaemin had been arranged to take place in the Tropics

Tropical Anaemias

Dr HAMILTON FAIRLEY said that these *macrocytic* anaemias played quite a large part in tropical practice The three types of anaemia which had been encountered were the tropical macrocytic anaemia tropical sprue and another anaemia associated apparently with malarial *infection* not improbably a tropical macrocytic anaemia with malaria superadded Until recently tropical macrocytic anaemia had been regarded as occurring only in places like India Africa and China Recently he was in Macedonia investigating blackwater fever, and there in adjacent wards he came across two cases of undoubted macrocytic anaemia associated with malaria quite probably these were *tropical macrocytic anaemias* The condition was quite common in the Balkans He could not help feeling that a great deal of work remained to be done from the clinical side on these anaemias in the Tropics before the problem was adequately solved

Dr JANET VAUGHAN said that personally if she suffered from pernicious anaemia nothing would induce her to be *treated with anahaemin she would prefer less pure pre*parations She also calculated that it would have cost her £7 to cure her last patient with anahaemin campolon would have cost much less Anahaemin marked a scientific advance, but she was doubtful whether it marked an outstanding therapeutic one The latest work suggested that in liver a very complicated substance was being dealt with, and it was safer for the present to treat patients with the relatively crude extracts which presumably contained all the principles—three had now been isolated—than to use the purer extracts which so far as known did not contain all the haemopoietic factors People should realize the danger of treating patients with these highly clarified fractions

Absorption and Excretion

Professor E C DODDS asked whether it was possible that the reason why the very pure preparations were not as good as the cruder ones was because they were more rapidly excreted On a different line of work with a substance like the ovarian hormone in the old days a crude preparation being used of the constitution of which nothing was known one injection would give oestrus but now with one injection of the crystalline substance owing to the rapid absorption and excretion oestrus would not be obtained Thus it might have been said that the old crude extracts contained substances which the pure crystalline preparations did not, but that was not the secret

Dr S W F UNDERHILL said that theoretically it would certainly seem that the cruder preparation should be absorbed more slowly but actually it had been found that anahaemin in quite small injections—1 c.cm a month —would maintain cases of *pernicious* anaemia There must be some means of storing the substance in the body for it was inconceivable that it should remain at the site of injection for that length of time A further point on this question of the use of crude and purified extracts was that with the purified extracts there was shown *from* batch to batch certain well marked characteristics such as *melting point* and especially rotation and from experience it had been found that if they showed rotation it was a very good indication of clinical activity whereas there was no real chemical or physical test in the case of the crude extracts on which reliance could be placed

Relation Between Pituitary and Gastric Secretion

At the *same meeting* Dr R L NOBLE presented a brief communication by himself and Professor E C DODDS on the relation between the pituitary and gastric secretion Severe gastric lesions in animals had been produced by posterior pituitary extracts The lesion was only obtained

ESSEX BRANCH SOUTH ESSEX DIVISION

At a meeting of the South Essex Division held at Westcliff-on-Sea on March 9 with Dr W H SARRA in the chair Dr J O W BLAND demonstrated as a British Medical Association Lecture the late Dr R G Canti's film of The Cultivation of Living Tissue Many questions were asked and a discussion followed On the motion of Dr J STEVENSON LOGAN seconded by Dr R SELLS a hearty vote of thanks was accorded Dr Bland for his address

GLASGOW AND WEST OF SCOTLAND BRANCH

At a meeting of the Glasgow and West of Scotland Branch, held on February 24 with Dr J B MILLER in the chair Professor JAMES HENDRY delivered a lecture on 'Recent Developments in Midwifery Practice' Professor Hendry said that the first hospital accommodation in Scotland for pregnant women other than deserted mothers during the ante natal period was a bed in the Edinburgh Royal Maternity and Simpson Memorial Hospital, endowed by the late Dr Free land Barbour in 1901 Since then provision for ante natal beds and clinics had grown rapidly but so far the great results hoped from it in respect of decreased maternal morbidity and mortality had not been realized the great weakness being a lack of continuous supervision before during and after childbirth Professor Hendry maintained that the staff of ante natal clinics should be attached to the same service that was responsible for the conduct of labour and that there must be better co operation between midwives medical practitioners specialists and research workers and improvement in both hospital and domiciliary practice With regard to the treatment of toxaemia the mortality from this in the Glasgow Maternity Hospital had dropped from 12 per cent in 1925-9 to 4 per cent in 1930-4 as the result of treatment of excessive vomiting Early recognition of this type of case was essential with immediate hospitalization The continued high death rate from eclampsia might be partly due to neglect of hypertension as an important precursor Even when persistent albuminuria was not causing deterioration of the patient's condition but had lasted for two or three weeks it was necessary to terminate pregnancy in the interests of the mother's future health since such persistence entailed permanent renal damage True nephritis in association with pregnancy caused early complications and often abortion Pyelitis had been found to be a very common complication of pregnancy and in its chronic form was often associated with debility and premature labour

Ante partum Haemorrhage

Haemorrhage early in pregnancy was a common indication of impending abortion In the treatment of abortion the most conservative measures should be employed the empty ing of the uterus in febrile cases being often followed by severe systemic infecting Special hospital wards should be kept for these cases In the later months ante partum haemorrhage however slight was an indication for immediate admission to hospital Diagnostic vaginal examination might bring on serious bleeding Maternal mortality in placenta praevia had been much reduced by Caesarean section and the free use of blood transfusion in the Glasgow Maternity Hospital this mortality figure had fallen from 12 6 in 1925-9 to 7 per cent in 1930 4 Special anxiety was always aroused when the patient had had a profuse haemorrhage in her own home Vaginal packing in these conditions was seldom efficient except if performed under anaesthesia when it increased the degree of shock The better policy was to give an immediate blood transfusion and to allow the shock to pass off to some extent before removal to hospital Accidental haemorrhage had been less successfully treated most of the patients being multipare with rapidly succeeding pregnancies In ante natal work radiography was most helpful though of less utility in cases of contracted pelvis the extent to which the head could be moulded and the strength of the uterine contractions being more important than the absolute size of the pelvis The strictest aseptic care should be taken during confinement Vaginal examinations were usually unnecessary when there had been adequate ante natal care but the character of the uterine contractions should be carefully watched throughout labour

Anaesthetics

The increased use of anaesthetics in childbirth was resulting in more interference Analgesic and amnesic drugs were best at first including chloral morphine scopolamine heroin and even nembutal a general anaesthetic was seldom necessary until the second stage The prolonged use of gas and oxygen was expensive The small dose of chloroform which was usually necessary for the passage of the head over the perineum was relatively innocuous Pituitrin in standard doses might be most useful in appropriate cases and obviate forceps application Overstretching of the vulva should be prevented by timely incision During the third stage the uterus must not be stimulated manually, if there was severe haemorrhage blood transfusion should be given Forceps operations were often necessary the low form need arouse no anxiety, but the mid-pelvic form caused more trauma and the high operation was hardly ever justifiable even in hospital practice Cases of pyrexia after pregnancy should be removed at once to an isolation hospital which improved the prognosis and prevented the spread of infection A new synthetic drug prontosil seemed to be a specific for puerperal fever due to the haemolytic streptococcus Professor Hendry concluded with a reference to the extraordinary drift of maternity cases lately into institutions and expressed the view that this trend would continue

LINCOLNSHIRE BRANCH KESTEVEN DIVISION

At a meeting of the Kesteven Division held at Grantham on February 23 with Dr W H WILKIE in the chair Mr R J McNEILL LOVE gave an address on 'Abdominal Emergencies in General Practice' A lively discussion followed, and a hearty vote of thanks was accorded Mr McNeill Love for his address

MALTA BRANCH

At the annual general meeting of the Malta Branch, held at the University on January 22, the retiring president, Professor P P DEBONO read a short presidential address on 'The Evolution of the Treatment of Fractures' The following officers were elected for 1937

President Colonel A Dawson, O B E *Vice President* Professor A V Bernard O B E *Secretary and Treasurer* Mr A J Craig

UNITED PROVINCES BRANCH

At the annual general meeting of the United Provinces Branch held at King George's Medical College, Lucknow, on January 29, with Lieut Colonel R S TOWNSEND, I M S, in the chair the secretary's report for 1936 was read and confirmed This showed that nine clinical and general meetings had been held during the year and that the Branch Council had met on five occasions also that the membership of the Branch had increased during the year The CHAIRMAN referred to the visit to India of the Medical Secretary Dr G C Anderson and certain arrangements were made in connexion with that visit The following officers were elected for 1937

President Lieut Colonel Townsend *President Elect* Professor B G S Achiry *Vice President* Captain R K Kicker *Honorary Secretary and Treasurer* Dr B B Bhatia *Honorary Auditor* Dr M A Hameed

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses ophthalmology at Royal Eye Hospital April 5 to 17 plastic surgery April 14 and 15 neurology for general practitioners at West End Hospital for Nervous Diseases April 19 to 24 heart and lungs at Victoria Park Hospital April 10 and 11, fevers at Park Hospital April 17 and 18 infants diseases at Infants Hospital April 24 and 25, cancer at Royal Cancer Hospital April 24 and 25 On Saturday April 3, at Preston Hall there will be a special demonstration on pulmonary tuberculosis (primarily intended for M R C P candidates) and on Tuesday April 6 at 8 30 p m there will be a demonstration on the fundus oculi, also intended for M R C P candidates Detailed syllabuses of all courses can be obtained from the Fellowship of Medicine 1 Wimpole Street, W

when hydrochloric acid was present in the stomach contents, but it was primarily related to a sudden cessation of gastric secretion The authors discussed the normal gastric response to insulin histamine, and sham feeding in a large series of animals The action of insulin had been tested on eleven such animals Following an injection of two units subcutaneously there was definite stimulation of the gastric juice This secretion appeared to be of nervous origin, any anaesthetic prevented the effect The stimulation produced an increase in all the contents of the gastric juice, the pepsin activity might be increased from fifty to one hundred times It was quite different with histamine, where there was only an increase of acidity The action of pituitary extracts on normal secretion had been investigated The vasopressor fraction had been found markedly to reduce the secretory response from all types of stimuli It was possible by this means to produce for a time a condition of achlorhydria during which even the most potent gastric stimulus—histamine—would not induce any secretion

Professor DODDS said that one object in bringing this work forward was to elicit the experience of others as to any known complete inhibitor of gastric secretion As far as they had been able to ascertain this pituitrin was the only substance which would inhibit every type of stimulus to gastric secretion In answer to Dr Lucy Wills he said that control experiments had shown that extract of thyroid had no effect at all

ANAESTHESIA IN AMERICA

At a meeting of the Section of Anaesthetics of the Royal Society of Medicine on March 5 under the presidency of Mr LANGTON HEWER, several members gave their impressions concerning anaesthesia in the United States and Canada

Dr R R MACINTOSH who was warmly congratulated on his appointment as Nuffield Professor of Anaesthetics, said that in the United States the nurse anaesthetist was very largely employed, and this created an economic situation which was not satisfactory to the private anaesthetist Skilled anaesthetists in America were not adequately rewarded for their services, their fees were lower than those of their British confreres Many of the large hospitals had numbers of paying rooms and wards, and the class of patients operated upon in this country gratuitously were required in the United States to pay a small fee Most of the work of the anaesthetist was done in the hospitals, where his apparatus also was stored, and he was spared the trouble of taking it about to private houses, as most serious sickness was treated in some institution In many cases the fees for private work were collected by the hospitals and in this way bad debts were avoided Many people on the other side ' had an idea that the giving of anaesthetics needed no more skill and training than giving a hypodermic injection or an enema The employment of the nurse anaesthetist did not meet with the approval of the medical profession as a whole nor, in particular of the Society of Anaesthetists Most of the women doing this work were well trained and competent, and his opinion was that they were infinitely better anaesthetists than were general practitioners who only occasionally give an anaesthetic Nurses, however were not allowed to give intravenous or intrathecal injections If at the present time the nurse anaesthetist were abolished there would not be nearly enough fully qualified men to do the work The rewards offered in this specialty were not large enough to attract students to it At Toledo a high skill had been attained in gas and oxygen anaesthesia, perhaps indeed it was overdone there whereas in this country it was not used enough At Toledo it was considered that the colour of the patient was no indication of the depth of the anaesthesia Certain schools in America seemed to make the same mistake which was made by some in England they confined themselves too rigidly to one or two kinds of anaesthetics

Experiences in Canada

Dr H W FEATHERSTONE based his remarks on visits he had paid to hospitals at Toronto and Winnipeg and especially the Mayo Clinic at Rochester He did not see chloroform used at all, ether was employed by the anaesthetist-nurse and by interns Atropine was rarely used before operation, but morphine and scopolamine were often so employed Abdominal relaxation was not called for so insistently as in this country In Canada he found that a cautious attitude was adopted towards new methods At the Mayo Clinic acute conditions, such as fractures and appendicitis, were comparatively rare, for the reason that Rochester was only a small town, and acute cases could only be brought from the immediate neighbourhood because of the time factor In an establishment of 1,800 beds there were only three fully qualified and trained anaesthetists In the U S A and Canada people with major medical and surgical conditions expected to enter hospitals for their treatment, and maternity cases of all grades of society were attended to in the maternity hospitals The proper assessment of the state of the anaesthetizing specialty was based on the general average excellence in routine work

Premedication

Dr J T HUNTER spoke of his experiences at the Crile Clinic at Cleveland and the Lahey Clinic at Boston He said he never saw a bottle of chloroform during the whole time he was in the States At the former clinic the work of the nurse-anaesthetist was not medically supervised, and there nitrous oxide was largely used, for abdominal operations a good deal of ether was added At the Lahey Clinic he was greatly impressed by the thoroughness of the detailed examination of patients and the completeness of the records kept The premedication doses used there were only about half those employed in this country a usual dosage was 1/12 to 1/8 grain morphine and 1/100 grain scopolamine In almost every hospital the continuous-flow type of machine was used In America the anaesthetist had the full support of the staff, and in carrying out designs for new apparatus engineers give their collaboration In England, on the other hand, the inventor-anaesthetist had to bear the cost himself With the research and the excellent tuition carried on in the States their results within a few years should be second to none in the world

Dr W STANLEY SYKES mentioned the lavish and beautiful equipment for anaesthesia to be seen in many hospitals Anaesthesia in the States, however, was not of universally consistent quality There were many places where it was badly neglected and entrusted to unqualified technicians Ethylene had slumped in popularity, though he regarded it as a very satisfactory anaesthetic within limits He spoke of the very fine equipment at Madison, Wisconsin and there also the tuition was very thorough Students were put through a course of anaesthesia on animals before being allowed to deal with humans

General Discussion

Dr R JARMAN commented upon the early start on the day's work which was the rule in America Another feature which struck him was that 98 per cent of the work in the States was paid for, and only 2 per cent honorary, a striking contrast to the state of affairs in this country He was impressed by the Lahey Clinic at Boston, but most of all by the clinic at Toledo Chemical firms in America gave grants for the purpose of trying out various gases, a kind of thing which could not obtain in England They knew that their drugs would not be accepted until backed by the signature of some university

Dr I W MAGILL said that in America no time was lost by the anaesthetist journeying from place to place with his cumbersome apparatus Most of the work was done in hospitals and the facilities offered for research were on a scale which could not be hoped for in this country for many years to come At the Mayo Clinic the laboratories

were at the disposal of the anaesthetist for testing any drugs, and the note taking was very elaborate A stenographer was present at the operations and noted down the number of seconds taken for each stage and so forth The value of the record thus obtained was beyond question Dr R E PLEASANCE referred to the excellence of the chloroform anaesthesia in the States, especially in connexion with gynaecological cases

DISEASES OF THE COLON

A meeting of the West London Medico Chirurgical Society was held at the West London Hospital on March 5, under the chairmanship of Mr NEIL SINCLAIR, when a discussion took place on diseases of the colon

Dr A F HURST discussed the symptoms in organic disease of the colon especially discomfort and pain the situation which was most characteristic and diagnostic in this respect was the left iliac fossa The next question to note was any change of the normal bowel habit, which always suggested disease of the intestines and more commonly of the colon The speaker mentioned the great importance of rectal examination and examination of the stools In his view there was no such thing as mucous colitis The mere presence of mucus was not evidence of colitis, it was normally secreted in persons taking aperients, all of which acted as chemical irritants of the bowel Mucus only indicated inflammation if it was present in a loose stool which was naturally produced and not the result of an aperient Colitis began exactly like an ordinary dysentery In this connexion a plea was voiced for the use of the proctoscope, an instrument which every general practitioner ought to use Nearly all cases of carcinoma of the rectum and colon originated in polypi Carcinoma of the colon might produce general ill health with no local symptoms, the possibility of its occurrence should be considered in any person over 35 who complained of general unfitness and in whom a general examination had yielded no result One other symptom in carcinoma of the colon which ought to be remembered was the presence of occult blood Pain in the left iliac fossa was often due to diverticulitis The vast majority of such cases could be treated medically, it was amazing how severe diverticulitis might yet respond to medical treatment comprising rest in bed a non residue diet, no aperient, increasing doses of belladonna with 6 ounces of liquid paraffin given as an enema at night

Professor GREY TURNER, discussing the subject from the surgical aspect, said that occasionally the inflammatory condition did not remain limited to the bowel, but there was localized peritonitis and a tendency to the development of internal fistulae He thought that there was a tendency in a case of fistula between the colon and bladder to attempt too much at one time if anything had been learnt during the last ten or fifteen years it was the extreme importance of dealing with such fistulae in stages When there was a communication between the large bowel and the bladder it was enough to advise preliminary colotomy in the first instance and only to attempt at a second intervention the more extensive operation which might be necessary Diverticula did not appear to have any ancestral relation to malignant disease though the two conditions occurred in the same types of persons and at about the same period in life Dr H W POST showed a large number of radiographs and discussed the two principal means of examining a patient—namely, by giving a barium meal which indicated the physiological condition of the large bowel, and by giving a barium enema which revealed the anatomical appearance and any pathological changes present It was very rarely that by means of an *x* ray examination carcinoma of the rectum could be diagnosed Mr CECIL WAKELEY said that the majority of carcinomas of the caecum were not diagnosed until there was a very large tumour they did not give rise to obstruction until an enormous growth overlapped the ileocaecal valve On exposing such a tumour it might be deemed to be inoperable, and a palliative ileocolostomy be undertaken But later it would be found that the fixity had disappeared such fixity being not due to the growth but to the superadded sepsis When the irritation disappeared after the colostomy the growth became more mobile One of the most important things which had become clear was that in carcinoma of the colon multiple operations had to be performed

Dr MAURICE SHAW mentioned the condition known as spastic or hypotonic colon, and its treatment by large doses of belladonna The other principle in the treatment of spastic colon was to recognize that its causes were often psychogenic, treatment must be largely a question of routine He had watched the treatment of colitis for some fifteen years no very significant advance seemed to have been made apart from dietetic treatment The most important point was to encourage the patients to take as full a diet as they could There was some possibility of doing good by protein shock, though Dr Shaw had found none in serum therapy Mr G F G BATCHELOR referred to the question of performing colectomy in the presence of secondary growths in the liver and cited a case in which such secondary growths in the liver were well marked clinically and at the operation He had performed colectomy, however and for two years the patient had been quite comfortable When the patient returned the secondary growths were in the pouch of Douglas and the liver was not enlarged Dr GEOFFREY KONSTAM said that he was always hesitant about diagnosing spastic colon, nowadays with all these accessory methods it was desirable to have some sort of confirmation With regard to the use of belladonna he pointed out that if this treatment were pushed to the extent which Dr Shaw had suggested it would prevent reading by paralysing accommodation the patient would not be able to speak because of the dryness of his mouth nor to eat because of the drying up of the secretions of his stomach

ALKALOIDS OF ERGOT

At the annual general meeting of the Society of Public Analysts Dr G ROCHE LYNCH was elected president for the year 1937 and on the invitation of the council Professor G BARGER, D S, F R S, gave an address on the alkaloids of ergot

Professor Barger said that at least eight alkaloids had been obtained from ergot a parasitic fungus growing on rye and other grasses These somewhat unusual bases, from a somewhat unusual source, comprised four pairs of interconvertible isomerides, in each pair one isomeride was laevorotatory had a powerful pharmacological action, and a great tendency to crystallize in molecular combination with organic solvents the other isomeride had a high dextrorotation had little pharmacological action, and crystallized without solvent All the alkaloids were hydrolysed to lysergic acid—$C_{16}H_{16}O N_2$—an indole derivative capable of isomerization the two forms of lysergic acid corresponded to the two series of alkaloids In addition to this acid ergometrine (the most important therapeutic principle of ergot) and its isomeride ergometrinine yielded on hydrolysis merely hydroxy iso propylamine the other alkaloids each gave instead of the amine a series of products ammonia a keto acid and two amino acids these more complex alkaloids were akin to peptides Thus ergotinine $C_{35}H_{39}O_5N_5$ furnished lysergic acid, ammonia, isobutyrylformic acid phenylalanine, and proline The pharmacological and toxic actions of ergotoxine ergotamine, and ergoclavine were very similar and highly characteristic In the case of all the alkaloids the molecular formula had been established with certainty by analysis and by hydrolysis

The various chemical and physical methods for the alkaloidal assay of ergot were discussed and finally an account was given of the two forms of the epidemic disease ergotism the gangrenous and the convulsive type, which raged in former centuries

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

DEATHS

McDONALD—Suddenly, on March 11 while on an Atlantic cruise John McDonald M A M B C M Glas, aged 67, of Sans Souci Longbridge Road, Barking Essex Burial at sea
WENYON—At Skailbrae, Dundee, on February 20, 1937, Edwin James Wenyon M B, M R C S, aged 84 years

FIBROCYSTIC DISEASE OF BONE

At a meeting of the Devon and Exeter Medico Chirurgical Society, held at the Royal Devon and Exeter Hospital on February 25 with the president, Dr R H NORMAN, in the chair, a paper by MR R WAYLAND SMITH, in association with Dr H F L HUGO, contained the notes of a case in which fracture of the neck of the right femur was associated with fibrocystic disease

The patient shown to the meeting, was a woman aged 70 who had sustained the injury by slipping on her doorstep on October 14 1936 Radiographic investigation revealed a fracture without much displacement, and showed in addition deformity of the upper third of the femur from fibrocystic disease extending from the head of the bone to beyond the great trochanter A pinning operation being considered impracticable the limb was put up in plaster of Paris, but the latter had to be removed after a week owing to a skin complication Resort was then had to extension and sandbags the outlook for ultimate union seeming to be poor Nevertheless the fracture healed, and she was able to get about on two sticks, a calliper still being worn

Radiographs were shown to demonstrate the condition as seen a few days after fracture and also observed quite recently Not only was there every appearance of firm union in good position but there was obliteration of the cystic disease to a great extent in the area affected by the fracture Mr Wayland Smith explained that in these cases union was aided by the periosteal reaction set up around the cystic disease, and thus in these two separate conditions (fracture and fibrocystic disease) reciprocal benefit had been the end-result of their association

Diagnosis of Paratyphoid B Infection

DR J C FULLER read a short paper on two cases of pyrexia which had been recently in his care, and in which the course of the febrile symptoms had been somewhat similar Eventually a diagnosis of paratyphoid B infection had been established in each instance

CASE I

A young unmarried woman had complained on November 26 1936 of a sudden attack of headache shivering and aching of the limbs On the following day the symptoms increased and there was difficulty in taking a deep breath On admission to hospital on November 29 the temperature had been 102·2°, the respirations 44 and the pulse rate 144 Grunting expiration was present, and physical signs of consolidation were noted at the base of the left lung posteriorly There was no evidence of any cardiac complication, and no enlargement of the spleen or other abdominal abnormality could be detected There was no sign of any joint disturbance A diagnosis of pneumonia was made and treatment appropriate to this condition was begun including injections of a mixed pneumococcal immunogen (antigen) On the fourth day after admission—apparently the eighth day of the disease—the temperature fell by crisis with coincident reduction in the respiration and pulse rates A total white cell blood count on the day of admission had been 7,100, on December 1 it was found to be 13,400 Up to the time of the crisis the bowels had been irregular, two actions on two days and no action on another For the next five days her condition had seemed to indicate a satisfactory convalescence except that the signs of resolution in the pneumonic lung were absent However, on the evening of December 9 the temperature shot up to 102·8°, remained at that point on the morning of the 10th and reached 105·4 on the evening of that day On the 18th the readings were 102° and 104·4 in the morning and evening respectively The pulse rate ranged from 100 to 130 in this second febrile period, she was listless with low muttering delirium There was some rigidity of the neck and a considerable degree of deafness She was now coughing up blood stained sputum but radiological examination showed no abnormality beyond a greying of the left middle and lower zone proportionate to the physical signs The blood count on December 17 showed a fall in the leucocytes to 6,800 the differential count being non indicative The cerebro spinal fluid was found to be normal in every respect and a blood culture proved sterile The stools however were relaxed and in view of this and the white cell count a Widal test was made on December 22 when agglutination was obtained up to a dilution of 1 in 500 to *B paratyphosus B* This organism was also recovered from the stools Eventually the patient made a slow but complete recovery—the temperature falling by lysis—and she was discharged from the hospital on February 11, 1937, after three negative findings in the stools

CASE II

A girl aged 9 was an inmate of a children's home and ten days before her admission to the Exeter City Hospital the matron reported that she had had a typical attack of influenza with the Government of India for 1934, which has been forty other children being similarly affected at the same period. She appeared to make a rapid recovery, but a few days subsequently she was noted to be listless and her temperature was found to be high On admission to the hospital the temperature was 105° and the pulse rate 136 Hyperpyrexia continued for four days and then fell by crisis, pneumonic signs appearing at the left base For nearly a week following the crisis the temperature remained normal and then rose suddenly to 102°, there was complaint of abdominal pain and she vomited on several occasions When seen by Dr Fuller on January 14 the temperature was 102° and she was pale and listless no rash was present Examination of the chest revealed a patch of consolidation at the angle of the left scapula and crepitations were heard at both bases There was definite leucopenia (3,400), and the Widal reaction was positive up to 1 in 125 to *B paratyphosus B* The child was transferred to the City Isolation Hospital and a few days later was found to have a typical rash The subsequent progress of the case offered no particular points of interest except that the fever was somewhat protracted

Local News

INDIA

Progress in Public Health

The annual report of the Public Health Commissioner recently issued, surveys the state of public health in British India and some of the native States The death rate was higher than in 1933, also the infantile mortality rate, while the birth rate was lower but such fluctuations are normal characteristic of the annual statistics of the country Although there is evidence of widespread undernutrition in India, there is no evidence of the poorer classes being worse fed than hitherto There is however, a great need of a comprehensive survey of food production in the country as a whole Until such a survey has been carried out the question of food supply in relation to the population, should the latter continue to increase as it did between 1921 and 1931 cannot be satisfactorily determined

PRINCIPAL CAUSES OF DEATHS

Of the total number of deaths during the year 58 per cent were attributable to the "fevers" group of diseases Violent epidemics of cholera are becoming less frequent a fact explained by the development of the public health services and the extension of the prophylactic use of cholera vaccine but there is as yet no clear evidence of a significant fall in the mortality rate in this disease This may be due in some measure to the general improvement in statistical registration leading to the recognition of hitherto overlooked centres of disease and thus offsetting the obviously beneficial results of preventive work There was increased plague incidence and mortality, but the disease was for the most part confined to the provinces of Northern India The female death rate from this cause was higher than the male, but comparative freedom from the disease was reported from the whole eastern seaboard, Northern Burma, Assam, Bengal the south

FIG. 2.

eastern parts of Bihar the western areas of the Punjab, and Upper Sind Small pox was only moderately prevalent, but an extension of compulsory vaccination to rural as well as urban areas is still needed and a wider practice of revaccination at school age. The degree and duration of immunity conferred by infant vaccination against small pox was investigated at the Belgaum Vaccine Institute and found to be much shorter than was previously believed, it may be taken as four years in one fifth of the children and seven years in one half Deaths from "fevers totalled nearly four millions in 1934 as compared with three and a half millions in the preceding year, rural rates exceeding the urban in all provinces Malaria mortality was fairly high and the debilitating effects of this infection were partly responsible for the exceedingly high mortality figures for influenza, pneumonia and dysentery It is estimated that there must have been over 110 million cases of malaria in 1934, and it has previously been computed in other quarters that such a figure is approximately correct There are probably about two million cases of tuberculosis in India a great number of these being found in Bengal Madras the Punjab, and Bihar and Orissa An increase in the future is feared since it is thought that there are many villages which have not as yet been exposed to infection and which consequently will afford a virgin soil for the disease Leprosy is more common in India than was formerly supposed, and probably a million cases exist The disease is especially prevalent among semi aboriginals or aboriginals who have left their tribal seclusion and hired themselves out to agriculturalists and industrial concerns A network of clinics has been established in endemic areas and early cases are coming forward in increasing numbers Leper colonies are overcrowded, and special centres are being established for 'burnt out' cases to lessen the congestion

MATERNITY AND CHILD WELFARE

A review in 1934 of the maternity and child welfare situation revealed an insufficiency of well qualified medical practitioners and health visitors There were five training schools in that year for health visitors, of the major provinces Bengal and the United Provinces alone had no course of training, but in the latter a scheme was ready to be launched An appeal is voiced in the report for the appointment of a special assistant director for maternity and child welfare in each province and the establishment of a central official controlling body to advise on and to direct policy Regret is expressed that the importance of sound environmental hygiene is very inadequately recognized and that this makes it very difficult to secure financial support for urgently needed reforms It is not infrequent to find that large sums are spent on roads or hospitals in large towns before a safe water supply has been provided Town cleansing is too often carried out at night, with poor results except in the larger towns, which are well lighted by electricity Nevertheless, Lieut.-Colonel G G Jolly I M S, officiating Public Health Commissioner with the Government of India, concludes his report with the statement that the 'sanitary idea" is beginning to penetrate the mind of India Interest is increasing in rural reconstruction, nutrition child welfare, and the prevention of epidemics He thinks that the time is ripe for a great step forwards

The Mission to Lepers

Mr Wellesley Bailey who founded in 1874 the Mission to Lepers, died in Edinburgh on January 29 at the age of 90 Born at Thornbury, Abbeyleix Queen's County, Ireland, he went out to India when 22 years old, with the intention of joining the Indian police, but he stayed for some time with a missionary friend, and consequently became attached to the American Presbyterian Mission as head master of the mission school in Ambala There was a small colony of lepers near the school, and Mr Bailey visited it regularly In 1874, when he returned home on his first furlough, he delivered an address at the Friends Meeting house at Monkstown Co Dublin, on the sad plight of the lepers, which aroused so much sympathy and interest that the Mission to Lepers was brought into being Twelve years later he returned to Great Britain as general secretary of the mission and for more than thirty years held that appointment, with his office in Edinburgh When he retired in 1917 he was appointed honorary superintendent of the mission and participated in its diamond jubilee celebration in 1934 The mission is now caring for some 15 000 lepers and their children in its own and in aided institutions in various parts of the world, the whole organization having evolved from an original small asylum in the Punjab

FRANCE

[FROM OUR CORRESPONDENT IN PARIS]

Hospital Services for All

At the last general meeting of the Confédération des Syndicats Medicaux de France diametrically opposite views were expressed regarding the development of the general public hospital for all classes of the community Only a generation ago the hospitality of the public hospitals was such that, as a rule, you had to be very poor to want to accept it As the quality of this hospitality has improved the social and financial status of the applicants for it has risen, and now it is becoming more and more tempting for the medical officers of public hospitals to favour their development for middle class more or less well to do patients Dr Renon of Niort has made such a success of the omnibus hospital that his advocacy of it made a great impression at the meeting It would seem that at Niort everyone is satisfied the doctors co operate and the citizens of all classes enjoy the benefits of hospital treatment like so many shorn lambs for whom a kindly Providence has provided modern air conditioning This idyll would, however seem to be the exception rather than the rule, and Dr Guillaume of Chaumont painted quite another picture If it is the truer one of the two the development of paying departments in public hospitals is a veritable menace to the general practitioner throughout the country It is difficult to escape the conviction that here, as in so many other problems, personalities count more than principles

Poliomyelitis in Paris

Professor L Tanon and Dr A Besson have recently undertaken a statistical survey of the incidence of poliomyelitis in Paris in 1933, 1934 and 1935 The number of cases in these three years was fifty-six forty three and seventy two respectively The deaths in the same three years were seventeen twenty two and nineteen respectively Only one arrondissement escaped all the others suffered more or less equally, the disease being evenly distributed irrespective of social strata in the community A peak in December 1934 and January 1935 was contrary to the conception of poliomyelitis as an eminently late summer and early autumn disease On the whole there were more cases among females than among males the female predominance in this respect being greatest in childhood Professor Tanon and Dr Besson stress the importance of the healthy carrier and of the abortive forms of the disease which are, in their opinion most numerous With poliomyelitis sporadically endemic in Paris and with the healthy carrier largely responsible for its spread they are sceptical of the value of disinfection measures on the death of a patient or on his removal to new quarters Whatever the nature of the infecting germ it would seem not to be viable for long out of contact with living beings and fumigation and suchlike sanitary gestures are probably of moral rather than material value

ENGLAND AND WALES

Education in Better Feeding

The Gas Light and Coke Company gave a reception at its headquarters in Westminster on March 11, when the nutrition film which this company recently produced was projected and a new venture of the company with a similar objective was explained by Sir David Milne-Watson, the governor The film is designed to bring out the significance of Sir John Orr's declaration that in a very large number of families not more than four shillings a week per head is spent on food Sir David Milne-Watson explained that inasmuch as over 90 per cent of the cooking in its area is done by gas, his company is closely concerned with the choice, treatment, and use of food and therefore it is intended to follow up the nutrition film as a contribution to the cause of better feeding by an educational campaign In half a dozen of its show-rooms in working-class areas of London a series of special lecture demonstrations are to be given under the general heading of "Better Meals for the Money" These lecture-demonstrations will show how, in the opinion of experts on diet questions, the sum of 4s 6d per head per week can be laid out to the best advantage in the selection and purchase of food A leaflet has been prepared giving a week's menus—breakfast, dinner, and tea—for a family of five The ingredients of these meals have actually been purchased in the areas where the lecture demonstrations are being given for 22s 6d in all Particulars are given of the time needed in preparation and the cost of the fuel for cooking each meal Sir David Milne-Watson pointed out that his company must not be taken as expressing any opinion as to the adequacy or otherwise of 4s 6d per head, but in view of the fact that large numbers of people have no more than this to spend it seemed desirable to set out how they might spend it with wisdom He added that the existing menu sheet was based on food obtainable at the present season and that in due course others would be prepared appropriate to the time of year The lecture-demonstrations would be made attractive by including a demonstration of the cooking of one or more of the listed meals and they would explain in simple terms the significance of recent discoveries about diet and the need for the right proportions of different types of foods, particularly protective foods Professor V H Mottram said that the meals represented, so far as the money would go, one of the most sensible ways of laying out the weekly budget, including as much of the right proportions of body-building foods energy foods, and protective foods as possible The film, for which Mr Julian Huxley is commentator, is a very interesting and ingenious production

Willesden Maternity Hospital

The clinical report of the Willesden Maternity Hospital, published under the auspices of the Willesden Borough Council is based on a survey of the first 3,000 cases attended at this institution The majority of these numbering 2,939 were booked cases showing a maternal mortality of 1·02 per 1,000 Sixty one emergencies show a mortality of 65·57 per 1,000 while the rate for all cases is 2·33 In a covering memorandum accompanying this report the medical officer of health describes the methods employed in Willesden with a view to reducing preventable death or disablement consequent upon child bearing With the opening of the maternity hospital in 1931 arrangements were made for ante natal care of the mothers at health centres under the supervision of the council's consultant obstetrician In this connexion special attention has been paid to the importance of health visiting Post natal care is also provided under similar conditions The memorandum stresses the importance of adequate feeding for expectant and nursing mothers It is suggested that this aspect of the problem has received insufficient attention and that it is desirable that mothers should receive meals under an arrangement comparable to the scheme applicable to school children It is also suggested that greater attention should be paid to the newborn infant and that a skilled paediatrician should be attached to the hospital for this purpose The memorandum envisages a future consideration of means to provide a further period of rest and recuperation following confinement Despite the extension of the hospital in February, 1935, accommodation is still inadequate, and for this reason 356 cases were refused admission between that date and October 31st, 1936

L C C Committees Medical Members

The committees of the newly elected London County Council were settled on March 16, and the distribution among them of the medical members is shown as follows Education Dr J A Gillison, Entertainments, Dr Bernard Homa, Establishment, Dr Homa and Miss Esther Rickards, F R C S, Finance, Dr S W Jeger General Purposes, Dr F Barrie Lambert, Hospitals and Medical Services, Dr C W Brook, Dr S Monckton Copeman, Mr Somerville Hastings, Dr Jeger Miss Rickards, with Dr H Winch (co opted), Mental Hospitals, Dr Lambert, with Dr Doris Odlum (co opted) Parks, Dr Lambert, Parliamentary, Dr Jeger, Public Control Dr Jeger, Supplies, Dr Lambert, Town Planning, Dr Gillison, Welfare of Blind, Dr Brook It will be seen that the medical members of the new Council are shouldering a full share of the committee work, which is by far the most important part of the Council's activities the only notable omission is the entire absence of medical representation on the Housing and Public Health Committee

SCOTLAND

Crichton Royal Institution

The annual report of Crichton Royal Institution Dumfries, by Dr C C Easterbrook physician superintendent, shows that the number of patients treated during 1936 was 1,231, and the number resident at the close of the year was 978, of whom 626 were private patients and 352 rate-aided patients During the year there were 298 admissions, 176 discharges and 77 deaths Voluntary patients under treatment in 1936 numbered 424, of whom none required to be certified, and of the 180 private patients admitted 70 per cent came voluntarily The service patients maintained by the Ministry of Pensions as private patients numbered ten Of the special stresses activating mental illness among the admissions biologic stresses comprising the critical periods of life were present in 60 per cent, strain of child-bearing 1 per cent only, psychic stresses, including worry, affliction and mental privations such as solitary life and want of occupation, 40 per cent, toxic stresses such as alcoholic excess 17·4 per cent of men and 2·4 per cent of women physical shock 7 per cent, and pathological stress of bodily disease 4 per cent The types of mental illness among the admissions were constitutional psychoses of melancholia dementia, mania etc, 87·3 per cent, psychoneuroses 3·8 per cent, organic psychoses 3·8 per cent, and congenital psychoses 5·1 per cent At the time of admission the mental illness had lasted for less than half a year in 56 per cent, under two years in 19 per cent and above two years in 25 per cent Of the discharges 105 were voluntary and seventy certificated, and the recovery rate was 34·5 per cent with 35·9 per cent improved among the voluntary patients, and 42·2 per cent with 14·6 per cent improved, among the certificated ones The general recovery rate of all cases was 37·9 per cent with 26·3 per cent improved, while the total duration of the disorder in those who recovered was less than half a year in 39 per cent and less than two years in a further 38 per cent The causes of death included fifty

HEALTH OF THE ARMY

REPORT FOR 1935

The general health of the military forces continued excellent during 1935 and in the annual report on the Army[1] for that year it is mentioned that the ratio of admissions to hospital was 392 1 of the strength or 10 5 per cent lower than in 1934 which was the healthiest year since the war The death and invaliding ratios also showed slight reductions but there was a very small increase (0 29 per cent) in the numbers constantly sick As in former years the report contains three main divisions a general survey of the troops at home and abroad with notes on special diseases, statements about the work of special departments—namely medicine surgery women and children hygiene pathology, dental treatment and medical examination of recruits and notes on the health of the Army in the various commands at home and abroad

Incidence of Diseases

The principal causes of admission to hospital were inflammation of areolar tissues inflammation of the tonsils and venereal diseases There were slight increases in the admission ratio in respect of skin diseases nasal catarrhs soft chancres dysentery and gonorrhoea but marked decreases in cases of inflammations of the tonsils and pharynx and in malaria There was a rather smaller decline in the incidence of diseases of the areolar tissues and local injuries The deaths numbered 370 corresponding to 2 per 1 000 of the strength as compared with 2 1 in 1934 and 2 3 for the period 1930-4 Judged by the average sick time for each soldier the least healthy commands were those of Jamaica Ceylon Mauritius, Malaya and China, while those with the lowest ratios were Bermuda Malta and Gibraltar Dysentery increased but was mild in character next to malaria bacillary dysentery is considered to be the most important disease in the Army abroad being one which may assume serious proportions under active service conditions Amoebic hepatitis and tropical liver abscess which used to be so serious have now been brought much better under control by modern scientific methods of diagnosis affording facilities for prompter treatment Malaria dropped from 4 272 cases in 1934 to 3 549 in the year under review the figures for India being the most satisfactory yet recorded despite active field operations on the frontier in malarial areas Reference is made to the great value of atebrin treatment The number of cases nearly doubled in Ceylon however in association with the general epidemic among the civilian population Pyrexia of undetermined origin still presents a diagnostic problem in India, as also does sand fly fever

There was a slight increase in the total number of cases of pulmonary tuberculosis and it is noted that there is a higher incidence in the Foot Guards the Royal Army Medical Corps and the Royal Army Ordnance Corps than in the rest of the Army The age period from 45 upwards has a ratio of 3 3 per cent which is greatly in excess of that for young soldiers There was a slight increase in the incidence of venereal disease the admission ratio having risen from 24 2 in 1934 to 27 in 1935 but it is still lower than the average of the five preceding years Work at Woolwich on the preparation of a mixed polyvalent vaccine of secondary organisms isolated from cases of gonorrhoea and non venereal urethritis indicates that this vaccine may aid in reducing the stay in hospital for this intractable disease Functional neurosis admissions increased but there was no change in the incidence of acute psychoses of which the most important is schizophrenia There was a satisfactory decline in the incidence of rheumatic fever The risks of rheumatic carditis in young soldiers have been much diminished by enforcing prolonged rest before return to active exercise is permitted In the treatment of fractures open operations especially plating have been very largely abandoned fixation of the fragments by pins or wire and the employment of the non padded plaster case are coming into more frequent use

[1] Report on the Health of the Army for 1935 Volume LXXI H M Stationery Office (3s)

Special Departments

The present system of specialization in medicine has been at work for fourteen years with very satisfactory results young officers are being trained as specialists and graded for appointments Three centres for cardiological investigation and diagnosis have been established in London Aldershot and Catterick under the supervision of the medical specialist of the area and patients needing particular attention are sent to the appropriate centre Since the situation of these centres corresponds to the main recruiting areas a check upon the enlistment of doubtful cases of cardiac disease is readily available These centres also provide valuable opportunities for officers who propose to specialize in medicine to gain a knowledge of cardiovascular disease and to work directly under a specialist before joining the senior course of training at the Royal Army Medical College In the first year's working at Millbank 208 cases were examined and 202 electrocardiographic records were taken of which 36 showed evidence of abnormal conditions of the heart It is expected that these centres will become of increasing importance more particularly in reducing the numbers of discharges for cardiac insufficiency among recruits with less than six months service In the section of the report devoted to surgery reference is made to the great value of the clinics for the injection treatment of varicose veins and haemorrhoids In the surgical work arising from the Quetta earthquake plaster of Paris casts were found to be superior to the usual cumbersome splint method in the transport of fracture cases and more satisfactory end results followed subsequent treatment Glucose stovaine spinal anaesthesia was found useful at the Cambridge Hospital and intravenous sodium evipan gave good results there and at Woolwich Percaine administration was similarly approved at Woolwich and Netley Radiological examinations were performed in 25 761 cases at home and in 23 449 cases in India great saving in costs being effected by the increasing use of paper film negatives New apparatus was installed during 1935 at Woolwich and Netley There was an increased amount of work in the massage and electrotherapeutic departments and the massage school at Netley was reorganized

Miscellaneous Matters

In the hygiene section of the report it is noted that a new departure in barrack construction known as the Sandhurst block has been evolved which incorporates many improvements making for the health and comfort of the men a central boiler provides hot water for the baths and ablution rooms with a steam supply for the cookers and for central heating A committee was appointed to deal more effectively with the feeding of small detachments and individuals and the ice ration has been extended to several stations abroad which formerly received no free supply the better facilities for preserving food have given general satisfaction

The Harold McKibbin ammonia chlorine method of water sterilization has replaced the chlorine method as the standard method in the Army Efforts are being made to provide more and safer swimming baths At Aldershot for the first time on record cases of leptospirosis occurred in connexion with the military swimming pools possibly because the very dry summer of 1935 lowered the water level and involved more contact with the subjacent mud which had been infested by rats Contamination of the sea beaches at Hong Kong caused some anxiety Closed subsoil drainage arrangements have come more into favour in barracks in Malaya As regards physical training it was shown at Aldershot that deep breathing exercises in association with gymnastic practices did not improve the vital capacity dorsal stretching exercises have been found to be liable to cause injuries and they are being replaced by true concentric dorsal exercises

The total percentage rejection of potential recruits on medical and physical grounds in 1935 was 4 5 4 as compared with 52 in the previous year the main defects found being gross under standards for height weight and chest measurements seriously defective vision loss or decay of many teeth and marked physical deformities

degeneration of the heart, apoplexy senile decay, and pulmonary diseases, the mean age at death being 62 4 years

Princess Margaret Rose Hospital

At the half-yearly meeting of the Princess Margaret Rose Hospital for Crippled Children at Fairmilehead Edinburgh, on March 2 the Earl of Home presiding the remarkable development of this hospital since its opening less than five years ago was described The hospital then consisted of one ward for twenty five patients, it now had four wards with accommodation for 100 children and a capacious massage department was under construction A system of clinics with an outdoor staff was being developed in the south eastern region of Scotland and energetic attempts were being made to obtain clinics in those areas which did not yet possess them The Edinburgh area had at present ten cases in the hospital, Fife and Clackmannan thirty two, East Lothian four Midlothian four Roxburgh four, and Berwick three, while private patients numbered fourteen The reason that there was a waiting list of eighty when there were empty beds in the hospital was because of the quota system, by which individual counties made definite financial grants for the orthopaedic services to patients from their areas The result was that a county which had thirty patients requiring treatment might only send five to the hospital at one time, the other twenty five waiting their turn, and it was only by additional allocations by the local authorities concerned that the number of patients paid for by them could be increased There were at present seventy-three such patients in the hospital A large number of out patients were seen regularly at clinics in the county areas, and as a result many incipient cases of crippling illness could be cured at an early stage and hospital treatment avoided The report showed that the financial position of the hospital had been improving and that it had been possible within the last few months to pay off a loan of £3 000 which had been granted by the Scottish branch of the Red Cross Society Legacies and special donations during the past ten months had amounted to £5 087, and the sum received in patients fees during this period had been £6 797 Against this the running expenses had amounted to £8 538 The report of the surgeon Mr W A Cochrane showed that from July 1936 to January 1937, 123 patients had been admitted as compared with seventy one in the previous six months and the patients discharged had numbered 108 as against sixty six

Perth Royal Infirmary

The income of the Perth Royal Infirmary for the past year was £17 438 and expenditure was £24 454 The Infirmary has received a bequest of £20,000 under the will of the late Miss Chalmers of Ashburton, New Zealand the last of a family which left Perthshire many years ago for New Zealand Many necessary improvements have been made since the Infirmary was opened in 1914 and as these have been met by expenditure of capital, the income from invested capital has decreased at the same time as running costs have increased The directors have decided to erect a new out patient department, and an appeal is therefore being made to the public to fill up the deficiency in the hospital s funds

Psychiatric Wards in General Hospitals

At a recent meeting of the Scottish Association for Mental Welfare Dr William Harrowes medical director of New Saughtonhall Mental Hospital, Edinburgh gave a lecture on Inadequate Health at which Dr W G Sym presided Dr Harrowes said that mental hygiene could be divided into two main branches, of which one was concerned with society as a whole while the other was devoted to individual problems A new outlook was the gradual recognition of the great extent to which health could be modified by emotional disturbances that were not temporary but semi permanent chronic and unconscious Faulty function of internal organs might readily influence the thinking functions but on the other hand faulty thinking might result in physical malfunction This principle was contained in the phrase concerning the influence of mind over matter, but the medical profession as well as the community in general had been slow to grasp its implications Much interest was aroused about two years ago when Dr Halliday of Glasgow showed that about one third of all the patients sent to a medical referee under the national health insurance scheme were suffering from physical malfunctions due to faulty mental hygiene and not to any organic physical disease It was not sufficiently recognized that almost any symptom might be produced by inadequate mental health As a result many patients wearied of an honest physician who told them that there was nothing wrong (which was in a sense true) and went to unorthodox advisers who told them that there was something very far wrong which could be put right Very often headaches, indigestion weak hearts rheumatism and constipation were matters of psychology and it should be recognized that insufficient health was in a high percentage of cases a matter of poor adjustment and poor mental hygiene Dr Harrowes suggested that to overcome this psychiatric wards should be established in association with general hospitals and children s hospitals should have a department for the maladjusted

Correspondence

A Civilian Ambulance Service

SIR —While the Home Office and local authorities debate and mature their plans for the protection of the civilian population in the event of war and aerial attack while doctors and policemen are given instruction in anti-gas measures and moneys are voted for the expansion of fire brigades we seem to hear comparatively little discussion of arrangements for the collection sorting evacuation, and treatment of the numerous civilian casualties which must, we know be visualized as occurring in spite of all these measures

The lessons of the last war and of Madrid, with their small scale raids have at least given us some measure of what we may some day have to anticipate, and we have reason to believe that gas and incendiary bombs may now be added to high explosive One or two large scale raids might easily fill all the hospitals of a city to overflowing City hospitals themselves might not escape damage It is evident that, in addition to aid posts and clearing stations large fleets of ambulances would be needed and that a circle of schools and other suitable buildings well beyond the outskirts of exposed towns would have to be equipped as hospitals to receive the casualties

There are many medical men in this country who will be unwilling for conscientious reasons to serve with the armed forces in any future war There are also thousands of men of military age who will refuse to fight or make munitions Remembering the fine service given by the Friends Ambulance Units and the British Red Cross Society during the last war on behalf of sick and injured civilians should we not be turning our thoughts to the provision of an adequate medical service for our own civilian population in the event of the attack which we hope will never come? Such a service would incidentally provide urgent and essential humanitarian tasks for numerous volunteers who might be unable or unwilling to serve with the armed forces in any way For London alone an efficient organization would require an army of able bodied ambulance drivers stretcher bearers and orderlies

There would be no lack of doctors and nurses with experience both clinical and administrative, gained in the

THE BRITISH SEA CLIMATE

HEALTH RESORTS CONFERENCE AT BOURNEMOUTH

Bournemouth at the week-end entertained a large number of medical men and others from various parts of the country the occasion being a conference of the British Health Resorts Association, which exists to underline the merits of British spas and coasts. Even in a wintry March Bournemouth appeared as charming as usual, as one speaker said Bournemouth is never out of season and is no curtained or shuttered town in winter and early spring. Care was taken to ensure that the visitors, in spite of two sessions of discussion, saw as much as possible of its natural advantages and its progressive spirit. The latest example of the latter is an establishment for indoor bathing to be opened at Easter. This is a fine addition architecturally to the sea front has cost £80,000 and includes a swimming pool, 100 ft. by 35 ft., surrounded by terraced seating accommodation for 600 spectators. In addition a variety of private baths have been provided, with a solarium.

Wintering in England

The opening of the conference was presided over by the Mayor of Bournemouth, supported by the Mayors of Poole and Christchurch and the first meeting was devoted to a discussion on "Wintering in England." The principal speaker was Lord HORDER who came to express his faith in the winter as well as summer value of British resorts, having in mind particularly the southern seaboard. Climatically the South Coast he said, had many advantages irrespective of the rather elemental question whether the sun shone or not. But when doctors were asked by their convalescent patients and others where they should go there was not much exact knowledge to guide them. The members of the medical profession wanted to know whom to send where." 'Change of air" did a large number of people good and some people harm, but it was difficult to say what change of air was likely to suit which person. A colleague of his, now retired from a lucrative practice had a flair for knowing where to send a patient. He could only explain it, 'It just comes to me I look at them. They tell me they never sleep at A and always get indigestion at B, and I send them without hesitation to Y or Z.' It was an example of empiricism. Lord Horder said that he himself had coveted but never possessed the gift. It was a matter on which doctors residing and practising in resorts might pool their experiences.

Lord Horder also had some advice to offer on the subject of hotels—a matter which evidently presents many sensitive surfaces. Where, he asked was the old English inn the inn of Dickens, and Fielding and Smollett and Charles Lamb? One speaker answered that licensing restrictions had killed it which evoked the comment in another quarter that these noisy and rollicking places would hardly suit the invalid in search of repose. On the subject of noise also Lord Horder had something to say and congratulated Bournemouth on substituting the quieter trolley bus for the grinding tram.

Sir JAMES MARCHANT treated the conference to a very eloquent address on the charms of the South Coast. He mentioned a suggestion made by Sir Leonard Hill that hotels might put up spacious verandas with moving screens for wind protection warm them with radiant heat and install mercury vapour lamps to give an ultra-violet radiation equal to sunlight.

Meteorological Records

The need for research at winter marine resorts was stressed by Dr. K. R. COLLIS HALLOWES of Torquay. He spoke in particular of meteorological figures. All meteorological stations should be controlled by the Meteorological Office. At some resorts the station was not under such control. Records taken primarily for publicity purposes might have little other value, giving "pocket climate" averages not comparable with those of other resorts. Even at controlled stations along the coasts the altitudes at which meteorological instruments were placed varied from 190 feet to 5 feet above sea-level. Earth temperatures were taken at some resorts and not at others. Some resorts recorded ground frosts and gales, others did not. At some the temperature of the sea was taken in shallow water from the beaches, at others in deep water from the pier. Thunderstorm statistics were apt to vary according to the opinions of the observer. At present the figures recorded for ultra-violet light were of problematical value, as the method used was not recognized by the Meteorological Office, and the recording tubes were likely to be differently read by different observers.

Dr. Hallowes also referred to the fact that the readings for a seaside day were often not those which would be recorded for the "invalid's day" (between 9 a.m. and 5 p.m. during the winter months). Few readings were taken at meteorological stations during those hours. Temperature and humidity records ought to be made during hours when invalids and others were out of doors. No accurate estimation of the number of rain days at any resort could be made without defining how many hours of rain there were in the "invalid's day," quite irrespective of the amount of rain which fell in the twenty-four hours. Another point made by Dr. Hallowes was that the elevation and exposure of hotels and boarding houses should be accurately stated. Hotels should also state whether they catered for invalids or not. Some hotels wanted invalids and catered for them, some did not want them and said so, and a few received them and did not cater for them.

In some general discussion the deficiencies of health resorts in some respects were frankly canvassed. Sir JOHN ATKINS mentioned receiving a letter from a patient whom he had sent to a health resort. "For some time I have had a suspicion you were getting tired of me, and now I am convinced of it. I can think of no other explanation why you should have sent me to this deadly dull place unless you thought I should shoot myself and so save you further trouble!" Dr. G. DE BRC TURTLE mentioned the value of sending the patient to a health resort in or near his native locality. It was generally of little use, for example, sending a son or daughter of East Anglia to the Cornish coasts. Dr. ALFRED COX, the secretary of the British Health Resorts Association, pointed out that a good many British health resorts did not set out to attract those seeking health, they were content to do that which required no particular exertion—namely, to entertain the visitors who came to them in shoals at holiday times. They were deliberately neglecting a great opportunity to make their seasons longer and their towns more prosperous.

Effects of Marine Climate

Dr. OTTO KESTNER of the Rowett Institute Aberdeen, formerly professor of physiology, University of Hamburg, gave a paper on the curative action of sea climate. He described some investigations in the health resort of Wyk on the island of Föhr in the German North Sea to which reference was made in the lecture published in last week's *British Medical Journal* (p. 555). The action of sea climate on the skin was well worthy of study. As Professor Kestner put it, under the stimulus of sea, sun cold air and cold water the capillaries of the skin learned gymnastics again, and the children could bathe in the sea and play naked in the open air, even in winter, without a decrease of body temperature. He referred to the work of Curschmann, who was now continuing on the Baltic Sea the work begun on the North Sea, eliciting that while the blood pressure of normal persons was neither increased nor lowered by sea bathing, in patients with high pressure such pressure was decreased, and could be decreased over a considerable time by repeated sea bathing. Curschmann called the seashore the "hypertonics' paradise."

last war, and it should be possible for these, in co operation with the Quakers, the Red Cross, and the St John Ambulance, and with or without the help of the Government or the municipalities, to organize an efficient scheme Such a scheme would be in the national interest At the same time it is not inconsistent with pacific endeavour to envisage alternative forms of humane assistance in the event of war While making provision for stricken men, women, and children, such an organization would help to disarm bitterness and avert a vast amount of unhappiness in connexion with conscientious refusal to give military service—I am, etc,

Cambridge March 11 JOHN A RYLE

Zinc Protamine Insulin

SIR—I would like to remove a misapprehension that may arise in some minds from your leader on the above subject It is stated that "Lawrence and Archer suggest that small doses of zinc protamine insulin come into action more rapidly than large doses" We do not think that any part of our article suggests this, but if it does it is our error When any difference in initial speed of action can be detected the larger doses are prompter

But, more important, it is clear from all the articles on zinc protamine insulin that large single doses of 30 to 50 units are being used, and that many patients have to inject more than 1 c.cm of the compound, as the only strength at present issued is 40 units per c.cm This is uncomfortable and bad for the tissues, and I think it essential that a stronger preparation, 80 units per c.cm, be marketed I hope that publicity in your columns will hasten this—I am, etc,

London W 1 March 15 R D LAWRENCE

SIR,—In his article on protamine and zinc protamine insulin in your issue of March 13 (p 542) Dr H P Himsworth makes a declaration which is very difficult to understand He says "It is regrettable that a knowledge of the blood sugar level should still enjoy the greatest vogue as the guide to treatment The finding of glycosuria indicates loss of food in the urine, the testing of specimens passed at different times in the day shows when this waste occurs and points the way to the necessary modification in treatment" Naturally, if one is going to allow one's diabetic patients to pass sugar the urine is a very convenient way of following up and rectifying their excessively bad periods What is the position, however, in the case of those patients who have a high sugar leak-point? Such patients are very common indeed, especially when their diabetes has been established for any period before they come under treatment Are they to be allowed to run high blood sugars throughout the day as long as they remain free from ketosis and glycosuria?

The aim in the treatment of diabetes would seem to be to keep the patient well, but in between meals to keep the blood sugar running as nearly as possible in the normal level The idea of this is clearly to rest what remains of the actively functioning portion of pancreatic tissue, and it seems to me that mere urine testing is far too crude a method to adopt if one hopes to achieve the end which I personally have in view I would rather put Dr Himsworth's statement the other way round and say that the relatively crude method of urinary sugar examinations is a sufficient guide to the early stabilization and treatment, but that after this it is essential to do adequate blood sugar estimations if one wishes to treat one's patient reasonably decently While it is true that the patient's physical condition is the most important factor, and that one ought not to be a slave to blood sugar estimations in the face of clinical evidence, it is also true that these give the earliest indications of faulty treatment or change in the insulin dosage required by the patient, and I am afraid that I shall not be persuaded to change my method of controlling my patients by Dr Himsworth's argument I consider the urine method of control too crude for *ultimate* optimum results

As regards zinc protamine insulin, the great difficulty I foresee is the safe standardization of patients The most undesirable time for insulin to have uncontrolled and unobserved action is during sleep at night, and even though someone else sleeps with them, as has been suggested, it would appear necessary for the other sleeper to be awake not a very practical proposition The greater difficulty would be in the case of those diabetics who suddenly improve and require rapid reduction of their insulin I foresee trouble in such cases with the insidious and often severe and not easily controllable hypoglycaemia which is reported to occur with these delayed action insulins Doubtless this will be overcome The end could be achieved by a good carbohydrate meal at bed time, but surely if the last meal of the day is properly regulated the night blood sugar will look after itself without the help of delayed action insulin

Protamine insulin is probably a safer preparation for routine use than is the zinc modification If the former is given as a morning injection its action is exhausted during the waking hours, and there is no risk of a progressive night hypoglycaemia, it could be assisted by necessary amounts of soluble insulin as required Is the zinc protamine insulin therefore a real practical advance on the original protamine product and, if used much will it not lead to excessive amounts of carbohydrate being supplied at night as a safety-valve? In the latter case it defeats its own end, and the diabetic may end with a higher night blood sugar than if he were treated by the older methods!—I am, etc,

London, S L 5, March 12 GUY BOUSFIELD, M D

Meningococcus Antitoxin

SIR,—May I venture to thank you for the kind remarks in the *Journal* of February 27, and add one further point to the letter that you were good enough to publish in your issue of February 20? As there described the anti meningococcus serum that proved successful clinically was standardized by employing the peritoneal route in mice At the suggestion of the late Captain S R Douglas, F.R.S, I tried the cerebral route for this purpose but without success Although the meningococcus' endotoxin was inactivated by the clinically potent serum when injected intraperitoneally, the mice that received the same mixture *cerebrally* all succumbed The cerebral route in short appeared to be too severe a test of neutralization in case of this powerful endotoxin—I am, etc,

St Bartholomew's Hospital, March 14 M H GORDON

Continuous Intravenous Saline Infusion

SIR,—Our thanks are due to Mr Hamilton Bailey and his associates for their article on continuous intravenous saline in the *British Medical Journal* of March 13 (p 552) This timely description places the procedure on a firm basis For lack of it many a good innovation spreads in a slow haphazard fashion, and is apt to suffer from misapplication Extensive use in the past four years prompts a few further remarks on what is likely to be taken up widely by the profession

Climates and Clinical Conditions

Sir WALTER LANGDON BROWN said that the effects of a marine climate on children for which Professor Kestner had given exact and scientific data had long been empirically recognized in England, and the South Coast had been the favourite situation for preparatory schools. Marine climates while in general providing humidity purity of air, and freedom from dust could be divided into the cooler more bracing type and the warmer more sedative type. To a certain extent the whole of Great Britain had some of the advantages of a marine climate for no part of the island was more than sixty miles from the sea. Not that it was to be claimed that the seaside offered a panacea in the way of climate. Gouty subjects usually did better at an inland resort as did those suffering from certain skin diseases. Some paroxysmal neuroses did not do well though in this respect as in so many others the asthmatic persisted in expressing his idiosyncrasy. It was sometimes said that certain cases of insomnia did not do well at the sea but he thought this applied only to bracing marine climates. At any rate he had found Bournemouth increase the capacity for sound sleep. For chronic bronchitis and emphysema the conditions provided at Bournemouth by equable temperature, humidity and pine laden breezes were admirable. Michael Foster had said that the more sedative and sheltered localities of the south were of great value as winter quarters also for cases of heart disease. This should be interpreted not to include those with any suspicion of active rheumatic carditis for which it did not seem suitable rather must they think of those with failure of the heart muscle whether due to old and quiescent valvular disease or to hypertension. Finally, Sir Walter Langdon Brown referred to the 'diseases of civilization —hypertension hyperthyroidism diabetes, and peptic ulcer. For all these a marine climate of the type provided at Bournemouth formed a useful part of treatment.

Where Bournemouth is Indicated

Dr S. WATSON SMITH of Bournemouth finally gave a careful survey of the differing values of British sea climates—the east coast of Scotland and the east south east and south west coasts of England. For Bournemouth itself he claimed not one but a number of climates —the centre of the town, in one of the several chines to the north of the town, or on the uplands behind. The newcomer to the Bournemouth district was often heard to complain of drowsiness with disinclination for effort and an inability to summon up energy to do more than half a day's work. Thus the place had been called enervating when in fact the soothing sedative climate might be exactly suitable to him if a plethoric person or with high blood pressure. Those suffering from the nervous disorders associated with the climacteric did well at a place like Bournemouth. As to whether the climate was suitable for rheumatic subjects, certainly rheumatic fever and acute articular rheumatism were practically unknown at Bournemouth. Rheumatoid arthritis and osteo arthritis were not difficult to arrest in that climate but fibrositis was best treated at a spa. Dr MAHOMED of Bournemouth added a few interesting experiences of the local climate.

A banquet was given at the Pavilion by the Mayor and Corporation in connexion with the conference. Dr W. ASTEN chairman of the Health Committee of the county borough proposed the principal toast that of The British Health Resorts Association and referred to the ever closer relationship between the medical profession and the work of local authorities. This mingling of voluntary and official effort was warmly to be welcomed, though he hoped and believed it would always stop short of the complete merging of the medical profession into a State service. Sir WALTER LANGDON BROWN made a happy speech in reply in the course of which he paid a tribute to the late Colonel R. H. Elliot, the real founder of the association who was he said among other things an excellent amateur conjurer and one of the greatest feats of conjuring he ever did was to make the British people proud of their health resorts.

Sir ARCHIBALD WEIGALL proposed the health of the Corporation, and made some observations on the importance of local government and the desirability that it should be of a non party character. The MAYOR OF BOURNEMOUTH replied, warmly upholding the excellence of British hotels as compared with their Continental rivals. Among the guests at the banquet were Sir Kaye and Lady Le Fleming and a number of others from Bournemouth and the locality.

GAS-AND-AIR ANALGESIA IN LABOUR

INVESTIGATION AT BARNET

For nearly three years at the Wellhouse Hospital Barnet, an investigation has been proceeding into the value of gas and air analgesia in labour. From time to time we have given publicity to this work and we have now received a copy of a report made by Dr John Elam, visiting anaesthetist to the hospital to the medical superintendent Dr Roland Segar which has been forwarded to the Barnet Guardians Committee and the conclusions of which have also been presented to a special conference held recently at the Midwives Institute. A series of 1 065 maternity patients have been taken 625 of whom were primiparae and of this number 648 (410 primiparae) experienced no pain after gas and air had been started 402 (207 primiparae) found great relief, and only fifteen were disappointed.

The object of the investigation was to find a method of affording relief from the pains of labour which would be absolutely safe and could be used by nurses or midwives without the necessity for the presence of a medical practitioner. The use of gas and air analgesia was first tried in October 1933 by Dr Minnitt of Liverpool who adapted for his use an American nitrous oxide apparatus. The Wellhouse Hospital immediately had a similar machine made and was in fact the first hospital in the South of England to employ the method. It is emphasized in Dr Elam's report that the whole of this work has been carried through by midwives and nurses and thanks are expressed to these members of the staff for their co operation in a procedure which must have added considerably to their responsibilities.

First Stage of Labour

For the first stage of labour this form of analgesia is hardly practicable administratively owing to the necessity of having the nurse or midwife in continuous attendance over perhaps a prolonged period the high cost of the gas consumed per case would also be a consideration, and there are other technical difficulties. For this first stage of labour it is considered better to rely on the use of sedative drugs such as morphine which give reasonable relief. It is in the second stage that gas and air proves its special value when the pains are becoming strong and frequent, and the patient is brought to the labour ward. The causes of the few failures have been carefully investigated. Some of them are due to the patient herself, her unwillingness to co operate or her nervous temperament or unsuitable type (the heavy athletic type is peculiarly unresponsive to gas and requires a higher percentage of nitrous oxide in the air than is usually given) and some to faulty administration imperfect technique failure of the facepiece to fit the patient comfortably and so forth. For the great majority of women however the method affords marked relief. In this series of cases no deaths occurred which could be attributed in any way to the analgesia, nor was there any increase in the forceps rate or the number of stillbirths.

1 In regard to indications (*a*) In major traumatic surgery where haemorrhage and shock combine to devitalize the patient it has proved highly beneficial Thus a heavy woman aged 44 who fell under a train in 1935 healed after a pulped left arm and leg were amputated close to the trunk, and is well to-day thanks to it The same is true of a young woman *with multiple compound wounds including a shattered ilium* In exsanguinated states due to ruptured solid viscera or ectopic gestation it sustains the vital organs Most of these cases also require and have received blood transfusion

(*b*) Where septic peritonitis and paralytic ileus complicate abdominal catastrophes rest is essential for the inflamed bowel This group merits separate recognition for it is one of the commonest treated by intravenous saline Even if at the early stages vomiting is not present it will ensue if the stomach does its duty and rejects all ingesta Meanwhile the need for fluid in other vital and unrestable organs continues and is often imperfectly supplied by large bowel saline feeding A woman of 78 years was seen recently with h pogastric peritonitis due to gangrenous diverticulitis and colostomy was an inevitable part of the operation The rectal and appendicular routes for saline administration were inapplicable In this case and several others of the same gravity the patient has recovered

2 In regard to dangers There is the need for assuring one self that nurses both day and night fully comprehend the significance of the procedure This has been deeply impressed *upon me as have the demands on time that it involves* Experience will reveal many minor pitfalls The major risk that needs underlining in red is sepsis One patient of mine died rapidly from septic phlebitis of the arm and multiple lung abscesses and I know of at least one other such case proved by necropsy Therefore the indication for its use must be adequate and the following precautions practised as far as possible Instead of inserting a cannula by open operation venous puncture by needle should be aimed at and signs of redness pain and tenderness along the vein or temperature warnings must be heeded Further I doubt the wisdom or even the need in most cases for giving six pints in the twenty four hours—that is approaching the maximum short of oedema of the tissues I now give the twenty four hours supply of two or three pints of 5 per cent glucose saline by day only to spare the patient the unsettling effect at night and I reinsert the needle for subsequent administration as required The veins and the circulation will tolerate this moderate violation of natural nutrition and it seems to give the required hydration while what is most important rigors and appreciable local reaction are avoided so that its use may be prolonged over a week or more

—I am etc,

Bristol March 14 A WILFRID ADAMS

SIR—An article in the *Journal* of March 13 (p 552) entitled 'Continuous Intravenous Saline Infusion' contains a number of statements which require comment First in the paragraph headed Indications, intravenous saline therapy is recommended for 'dehydration from any cause such as starvation, vomiting, diarrhoea, or excessive sweating Now it is quite reasonable to give sodium chloride to patients who can be shown to be suffering from a chloride deficiency, but surely not otherwise And why into a vein?

Intravenous saline is also recommended for the treatment of anuria, rather the opposite of dehydration, one would think Now physiologists have shown that intravenous saline causes a diuresis, which might be desirable in cases of anuria But how, then, can it possibly benefit an already dehydrated patient if he is going to suffer a diuresis? Rectal or oral saline is capable of restoring the body fluids much more effectively As a matter of fact, intravenous saline does work in certain cases, having a transient effect in raising the blood volume but it is surely a grave mistake to describe 'normal saline as being manifestly physiological' It may come as a surprise to the authors to learn that the normal plasma chlorides are about 0 585 per cent expressed as sodium chloride The 0 9 per cent so called physiological saline is therefore obviously too strong and will produce a diuresis and in those cases where the kidney function is slightly depressed, so that the chloride concentrating power of the kidney is deficient *a net loss of fluid may be sustained in the* effort to rid the body of the excess of chloride

In Conclusion the authors refer to the advantage of intravenous medication in that the rate of flow and the amount of fluid given can be regulated with mathematical precision If the authors were capable of determining exactly how much fluid were required this would indeed be an advantage especially if they used 0 585 per cent instead of normal saline But I submit that the patient's body knows better, and the ordinary routes for fluid—mouth and rectum—give it an opportunity to absorb just as much as it requires Finally, they state that the choice of methods for estimating when the patient has received enough fluid lies between an estimation of the plasma protein and the rough and ready method of comparing intake and output I fail to understand how an estimation of the plasma protein can possibly be taken as an indication that the patient has or has not received sufficient fluid

As I am placed in the list of references I should like to repeat some of my own conclusions The best method of fluid replacement if the oral route is contraindicated is per rectum, preferably by continuous drip Since pulmonary oedema may result from abnormally low percentage of protein in the plasma, and since intravenous fluids tend to lower this percentage, the level of the plasma protein should be ascertained before giving fluid intravenously

The blind pumping into a vein of fluids without previous knowledge of the exact deficiency is to be condemned In my opinion intravenous saline should never be used unless the oral or rectal routes are absolutely contra indicated—I am etc,

W W WALTHER

Department of Pathology Queen Mary's Hospital for the East End March 13

Nasopharyngeal Sepsis in Cases of Mental Disorder

SIR,—I was greatly interested by Dr T C Graves's article in the *Journal* of March 6 (p 483) The account of nine years' unremitting pioneer work in this type of investigation reflects the greatest credit upon the author and his staff, and can leave no doubt in the mind of the reader that nasopharyngeal sepsis is often present in those suffering from mental disorder but to what extent it should be considered the cause of such trouble is not I feel made clear

Considering the amount of clinical material dealt with—2,056 cases examined and treated—it would have been helpful and more convincing to have been informed of the number of cases wholly or partially cured first of their sepsis and secondly of their mental disease Every rhinologist will have encountered cases of such sepsis latent or overt, accompanied by *symptoms of neurosis and psychosis* in a varying degree and witnessed the satisfactory results both local and general of treatment in such cases but few if any will have had access to anything like the number of advanced cases of this type dealt with by Dr Graves and it is for this reason that all would I feel sure welcome the publication of the results of this type of treatment—I am etc,

J B CAVENAGH

Worcester March 10

Expense and Applicability

Attention is drawn to the test carried out by the British College of Obstetricians and Gynaecologists (*Journal* February 8 1936 p 273) in which it was stated that gas and air administered by the Minnitt apparatus was a safe and satisfactory method At the same time mention was made of the expensiveness of the nitrous oxide The figures at Wellhouse, however, do not seem to be very formidable The total cost for gas to the maternity unit over the investigation lasting nearly three years was £117, working out at 2s 3d per case

The value of the method in hospital use having been established the question now arises as to its applicability to the large number of women attended by midwives in their own homes Dr Elam mentions a machine made by the Dental Manufacturing Company specially for Well-house described with illustrations in the *Journal* of September 26 1936 (p 630) This is a portable machine in the sense that complete with gas cylinders, it weighs only 70 lb and can be easily attached to the handle-bars of the midwife's bicycle Dr Elam expresses the hope that mobility has not been reached Further work has yet to be done in providing some sedative drug for giving relief in the early stage of labour and to eliminate the causes of failure to obtain adequate relief in the second stage

Reports of Societies

EFFECTS OF PROLONGED DORSAL DECUBITUS

At a meeting of the Medical Society of London on March 8 with Mr W E TANNER in the chair, a discussion took place on the effects of prolonged dorsal decubitus

Mr G R GIRDLESTONE of Wingfield-Morris Orthopædic Hospital Oxford said that evidence of statistical value on this subject would be difficult to obtain, he had therefore to rely on the investigation of a relatively small group of cases and on clinical experience On the question of the shape of the thorax resulting from dorsal decubitus opinions rather differed Two colleagues had mentioned some antero posterior flattening, which had been countered in one case by exercises and in the other by the subsequent adoption of the ventral position But in twenty patients who had been out of hospital for more than a year and who previously had been in dorsal decubitus for more than a year no abnormality in the shape of the thorax was detected Various abnormalities had been recorded in the lower limbs, but these were mostly a matter of control partly by splintage and partly by nursing attention In the old-fashioned bed with the body inadequately supported and the nursing inadequate such developments as flexion deformity of the hips, pes cavus dropped metatarsal heads, and claw-toes took place, but among the twenty patients just mentioned only one continued to show such a deformity (slight cavus) Lordosis of the spine might be brought about very easily by an unrecognized flexion deformity of the hip, and a fixed lordosis was almost impossible to correct by passive movements Scoliosis was another insidious development, usually arising from an organic cause, but sometimes following nursing without maintenance of the anatomical position of the pelvis

Patients who had been for a long time on their backs were more than usually sensitive to shock during and after prolonged operations He had been unable to trace any lowering of blood pressure from prolonged dorsal decubitus No abnormality of the function of the kidneys as a result of posture had been noticed Dorsal decubitus predisposed to renal calculi the incidence of which was abnormally high in orthopædic hospitals But here two factors were at work—namely posture and infection In his own hospital with probably one hundred patients in dorsal decubitus, there had been only eight cases of stone in ten years, and during the last five years with special measures of precaution instituted he could find only one case in which stone had developed in the hospital

Bed-sores used to be a common effect of prolonged dorsal decubitus In orthopædic hospitals they were now very rare, thanks largely to highly trained nursing In his own hospital there had been only one case of the kind during the last few years, a case presenting an incurable and most persistent trouble Finally, there was a psychological factor to be considered in these patients What was the effect of prolonged dorsal decubitus on the mind? A great deal could be done by the design of wards and provision of occupation to make time pass purposefully and even pleasantly, for Nature seemed to give an extra allowance of patience and courage to meet the tedium of prolonged recumbency

Renal Calculi

Mr JOHN EVERIDGE said that as consulting urologist to the Cushilton Hospital he had seen a number of cases of renal calculi associated with dorsal decubitus He had worked with Dr Pugh, who evolved the excellent frame which had done so much to diminish the incidence It was rather strange that more attention had not been drawn to this distressing complication He could find no reference to it previous to the war, and only brief allusions since The cases at Carshalton were mainly those of tuberculosis of spine or hip, but there were some cases of septic arthritis The majority of the patients had been treated for a considerable time at other orthopædic centres, and on admission there might already be evidence of the existence of stone In the vast majority urinary sepsis complicated the picture, the organisms found being chiefly *B coli* and occasionally *B proteus* Urinary sepsis was very prone to occur in children kept on their backs especially girls It was difficult to avoid contamination during defæcation, and there was little doubt that the infection was an ascending one by way of the urethra Apart from the cases of stone, a large number had pyuria In many of the cases the stones gave no pain, and the condition was brought to light by a painless hæmaturia The prognosis was bad, but not perhaps quite so bad as might be imagined There were many cases of what appeared on x-ray examination to be huge calculi; but when the children got up the shadows completely disappeared It was assumed that such shadows were not due to formed calculi but to a silting up or the formation of what were called mud stones, and when the children got up and normal metabolism was restored this mud came away But even formed stones came away to some extent

General Discussion

Mr WOODD WALKER said that it seemed unlikely that gravity should make any difference to the emptying of the pelvis of the kidney There was very little evidence that the upright position of man as compared with animals made any difference to kidney drainage Dr G VILVANDRI said that with disuse there was marked decalcification of the bones, and it was this which led to the formation of calculi Mr A SIMPSON-SMITH maintained that posture or gravity must have a very important bearing on the subject He added that during the past three years at the Lord Mayor Treloar's Hospital at Alton he had seen about half a dozen cases of renal calculi in tuberculous spines

Mr WHITCHURCH HOWELL spoke of children suffering from dislocation of the hip His attention was drawn to the subject in 1920 by seeing a child with a bilateral dislocation of the hip-joint in whom, for a few weeks after reduction, hæmaturia occurred and renal calculi developed in both kidneys He then devised a pelvic rest arrangement by which, as soon as the child was recovered from the anæsthetic after reduction, Fowler's position was maintained and a hinged support enabled the action of gravity to take place Since then he had had no cases of renal calculi or hæmaturia Patients in the old days were kept

Treatment of Allergic Conditions

SIR,—In the *Journal* of February 27 (p 438), Dr E M Fraenkel goes very fully into the question of the diagnosis and treatment of allergic conditions As regards treatment, everyone admits that if a specific allergen can be detected in a particular case specific desensitization is the ideal method It is unfortunately true that the ideal method is seldom applicable Dr Fraenkel himself says

> As the complete range of allergens that are responsible can rarely be discovered in any one case, I make use of those specific allergens that have been detected mixed together with either peptone or small quantities of old tuberculin"

Scientific advance consists essentially in discovering relations between apparently isolated phenomena Thus, for a long time it was known that rickets was benefited by cod liver oil taken internally, and also by ultra-violet light applied to the skin These facts remained unrelated until the discoveries (1) that vitamin D was essential to skeletal development, (2) that cod liver oil contained vitamin D, and (3) that by action on ergosterol in the skin ultra-violet light produced vitamin D Now it is a clinical fact, which can be verified by anyone who cares to look into the matter, that a large proportion of all cases of allergic asthma can be relieved in varying degree by suitable x-ray treatment In most cases the desired result can be obtained by exposing the trunk below the diaphragm, the chest being covered This was first demonstrated by Scott at the London Hospital Good results may also follow exposure of the chest itself, especially where there is a definite bronchitis as well as asthma Many of the phenomena produced by x rays are akin to those seen in protein shock, and one wonders if x-ray effects in allergic conditions are obtained by any process analogous, at second hand, to that of Dr Fraenkel's non-specific injections

This is unlikely to be the whole explanation, because the good effects of a single course may sometimes last for years on the other hand, it seems impossible to predict in any given case how long the "cure" will last From a practical point of view many apparently hopeless invalids who have for years had to have adrenaline injections several times a day are restored to useful life

Much research is needed to determine, for instance, how much of the effect is due to action analogous to protein shock how much to possible action on ductless glands or to the effect on the sympathetic nervous system So much attention has been concentrated on the local action of x rays that it seems to be forgotten that there are constitutional effects—in other words that x-radiation is a powerful "drug" with an action worthy of study by pharmacologists In the past it has scarcely been worth while to show "cured" asthma patients at clinical meetings as the invariable criticism is made that the effects, though genuine are due to psychological causes Recently modifications of the sedimentation test (differential sedimentation test using vanadic acid and an interferometer) have made it possible to show that the blood serum undergoes definite changes in allergic conditions, and that it may be brought back to normal by suitable x ray treatment

Asthma is such a chronic condition, and x rays when effective give relief so rapidly, that it seems a pity they are not used oftener as a routine before resort is had to more tedious methods

The technique is simple and can be carried out, if necessary, with a small diagnostic set Voltages of 80 to 100 kV are very suitable The field should be wide—about 12 inches in diameter and not more than 50 r on the skin given twice a week A 3 mm filter of aluminium is used It is best to begin with a subdiaphragmatic field Many of these cases are extremely sensitive to radiation, and it is the radiation absorbed *per cubic centimetre of body tissue* which seems to count Hence the danger of high voltages, even though the skin dose may remain small With treatment twice weekly relief should be experienced within three weeks If such relief is not very evident after six sittings, those not experienced in the method would be wise not to persist

A similar technique often gives relief in allied conditions, such as mucous colitis In these days a diagnosis of malignancy immediately raises the question of radiation treatment, there is equally good reason for thinking of it where either allergy or chronic inflammation is concerned—I am, etc,

London, W 1, March 4 F HERNAMAN JOHNSON

Ovarian Pregnancy

SIR,—The recent correspondence in the *Journal* on intraperitoneal haemorrhage from a Graafian follicle prompts me to report an authentic ovarian pregnancy

On June 25 1936, I was called at 11 a m to a patient aged 26 years, married, and with one child aged 5 years The history was of a sudden severe abdominal pain and collapse, at 8 a m the same day At first sight the case suggested a ruptured ectopic pregnancy, but against this was a history of a normal period three weeks before, and external haemorrhage was completely absent The patient was removed to the Crewe Memorial Hospital, where Dr Howard English did a laparotomy under open ether

The peritoneal cavity was full of recent blood clot, when this was sufficiently cleared its source was found to be the left ovary The haemorrhage had stopped (from the severe loss and fall in blood pressure), and a clot half an inch in diameter was adherent to the ovary The clots were swabbed out and the ovary was removed, the uterus, both tubes, and the right ovary being normal The abdomen was closed, other organs were normal Recovery was uneventful Section of the specimen showed an ovarian pregnancy

At first sight this was a ruptured ectopic pregnancy, the short time from the last period and the absence of external haemorrhage were confusing At operation to have treated this case as a "lutein haemorrhage" and left the ovary *in situ* would have been a disaster From the laboratory report prolonged research was necessary to confirm the fact of an ovarian pregnancy, which leaves the question open as to whether it is wiser to remove the ovary in all cases

This report was typed before Mr J C Leedham Green's interesting letter appeared in the *Journal* (March 6, p 527) But why must the tube be sacrificed? I thought one of the criteria of an ovarian pregnancy was the absence of trouble in the uterus, the tubes, and the other ovary—I am, etc,

Crewe, March 6 W L ENGLISH

Prostatectomy by the Two-stage Method

SIR,—I have read with interest the letter from Sir William Wheeler (*Journal* March 13, p 581) on the present position with regard to the surgical treatment of prostatic obstruction His statements will, I feel sure, prove acceptable to most reasonable surgeons I regret that in my previous letter (*Journal*, February 27, p 472) I seem to have created an impression of overwhelming bias in favour of the Harris technique, this was certainly not my intention I did resent Mr Irwin's obvious complacency in his championship of the older methods, and disliked his aspersions on the technique of my friend, the late Mr S Harry Harris As the result of following in detail the technique taught to me by Harris I have

THE IDEAL ANTACID

Magnoleum is an emulsion of liquid paraffin and magnesium hydroxide prepared entirely by mechanical means without the aid of any constipating mucilaginous emulsifying agents Its action is that of its active ingredients in an extremely fine state of sub division Being perfectly miscible with water or milk it may be diluted before taking, given to bottle fed infants in food, etc. It is readily acceptable to children and delicate or fastidious adults Issued in convenient wide mouthed glass bottles 1/3 and 2/6 Write for specimen for clinical trial

KERFOOT

MAGNOLEUM STOMACH CORRECTIVE

Made in England by THOMAS KERFOOT & CO LTD Vale of Bardsley Lancashire

4 & 8 oz BOXES

In Anæmias and Pernicious Anæmia

HEPFEROL contains per 100 grammes as much vitamin B-containing liver substance as corresponds to 35 20 oz fresh liver combined with 5 grammes active iron With a daily dose of 3×10 grammes the patient is able to take as much liver as corresponds to the assumed recovery dose, as well as the necessary additional iron

In cases of pernicious anæmia and in all anæmic conditions which do not respond sufficiently to iron therapy alone HEPFEROL is especially indicated

Prepared in palatable granules from a standardised dry liver extract its constancy is guaranteed

TRADE MARK **Hepferol** BRAND

Active Liver Principles with Iron in Palatable Granule Form

Samples and literature will gladly be sent on request to the agents

COATES & COOPER LTD
94 Clerkenwell Road London E C 1

"Pommie"
EXTRA DRY

THE IDEAL PICK-ME-UP, AS SHOWN AT THE BMA EXHIBITION, OXFORD

Free samples will be sent with pleasure on receipt of Professional Card quoting BMJ'

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test
The Iron 'Jelloid' Co Ltd, King George's Avenue, Watford, Herts

LESLIES ZŌPLA

STRAPPING is available on elastic cloth as well as the usual cloth

Thoroughly reliable under all conditions

A Popular Strapping
High Quality Low Prices

Strongly self-adhesive White or flesh cloths

ZŌPLA-BAND

(Zōpla Elastic Plaster Bandage)
The ideal treatment for varicose ulcers, sprains, etc

Material is very elastic, cream or flesh cloths

ZŌPLA ON WHITE FELT

is coming to the fore Used as a padding and for protection Does not become hard in use, and is long lasting Many thicknesses and compressions

SAMPLES ON REQUEST

Manufactured by
LESLIES LTD., Higham Hill Rd., Walthamstow, LONDON, E.17

achieved results which I believe to be much superior to those achieved by other methods, and particularly that sponsored by Mr Irwin At the same time I fully realize that the Harris technique is not suited to every case or, for that matter, to every surgeon Different patients call for different methods of treatment, and thus in some cases I would use the method of transurethral resection and in others the method advocated by Sir John Thomson Walker, or even in an odd case that described by Mr Irwin In Mr Irwin's letter of March 6 (p 528) there are some statements not dealt with by Sir William Wheeler which call for comment

1 The catheter in the urethra and bladder does not remain in for twenty or more days in the majority of cases Twenty days (ten before operation and ten after) should be regarded as a maximum Preliminary bladder drainage for seven days ensured satisfactory renal function in 69 per cent of Mr Irwin's cases and it thus follows that on Mr Irwin's own figures catheter drainage would have been necessary for only seven days before operation in that percentage of cases Many cases require no preliminary drainage so that ten days of catheter drainage following the operation suffices

2. Mr Irwin states that he has visited some of the patients operated on by one of the greatest exponents of the Harris technique when I have watched the pus dripping from the urethral meatus of a swollen penis etc I have never seen such a sight myself I consider it must be a rare occurrence and probably the result of submitting patients to the Harris operation before the greatest exponent realized the immense importance of meticulous care in the preliminary treatment so stressed by the late Mr Harris The 'greatest exponent' must have been a man (or woman) of the greatest honesty to exhibit such cases to Mr Irwin They were probably shown as a warning of what may occur should there be any deviation from or modification of the treatment laid down by Harris

3 I admire the fortitude of Mr Irwin's patients who suffer gauze packing to be removed from the prostatic cavity without anaesthetic and without complaint

4 Mr Irwin would like to know my grounds for thinking that the Harris technique is a tremendous advance on the Thomson Walker operation I should have thought that I made the advantages sufficiently clear in my letter (*Journal* February 27, p 472) In Mr Irwin's opinion the Thomson Walker technique *in which the patient is left with a large* vesical outlet is infinitely superior to that of the Harris method in which the patient is left with a deformed vesical neck Is Mr Irwin quite sure that when complete healing takes place after the Thomson Walker technique there is a large vesical outlet? Even if one admits such a statement is a large vesical outlet a natural condition? What grounds has Mr Irwin for stating that the Harris method results in a deformed vesical neck? It seems much more probable that after the Harris operation the condition of the vesical neck approaches more nearly to the normal than after any other prostatectomy operation

5 Mr Irwin's sophistry in endeavouring to make clear that when he writes the mode in which the bladder neck is sutured round the indwelling catheter really means that the bladder neck is *not* sutured round the catheter is too much for me

6 Mr Irwin criticizes the results of two operations performed by the late Mr Harris during his visit to this country in 1935 The result of the Harris operation depends almost entirely on the preliminary treatment I would need to be assured that in the cases mentioned Mr Harris had complete control of the preliminary treatment before apportioning any blame for results which did not attain to the high standard he himself set Moreover it would be wrong to say that after every Harris operation the wound remains absolutely dry when the catheter is removed in my previous letter I referred only to the average case In many of my earlier cases leakage persisted *from a pin hole suprapubic sinus* for any time up to ten days after removal of the catheter I think the leakage was due to a flaw in my own technique which I have now mastered as recent cases have healed by first intention

7 Mr Irwin takes it upon himself to make the statement *that it is absolutely impossible* to prevent puckering and pocket formation in a very large percentage if not all of the patients I must regard this as mere vapouring in the absence of adduced evidence

8 It is significant that Mr Irwin makes no mention of residual bacilluria or the time required for healing of the suprapubic sinus in the method he advocates Two of the most important points in favour of the Harris operation are the prompt healing of the abdominal wound and the rapid disappearance of bacilluria

In conclusion there is one thing I should like to emphasize, and that is that any new method in this difficult branch of surgery demands practice and experience over a considerable period before its value can properly be assessed Premature judgement, above all things, is to be deprecated—I am, etc,

Glasgow March 8 WALTER W GALBRAITH

SIR—I was very much interested in Sir William Wheeler's letter (*Journal* March 13, p 581) in which he diagnoses a rise of temperature in Mr Galbraith and myself I can assure him that in my own case there has been no rise of temperature, and I have only been concerned to state the results of my own experience

Sir William says the type of operation should vary in accordance with the surroundings I cannot imagine any surgeon of experience undertaking a prostatectomy outside a hospital or nursing home and it is a surgeon's duty to get the right surroundings before operating Sir William accuses me of coming to conclusions with regard to the Harris operation as a result of observations made on a case I have certainly not done so and I should never base my conclusions on observations made on one case alone

Sir William states that he varies the operation of prostatectomy to suit to the best of my judgement each individual case Sir William in this way gives us to understand that he can evaluate the patient's power to withstand a certain operation I am constantly coming across cases which were considered ideal for the Harris operation but which in the event have proved unable to stand the extra strain imposed by the Harris technique Consequently I feel it a much better policy to work on the argument that what is good for a bad risk is also good for a good risk

When the gland is removed writes Sir William and the cavity visualized it may be obvious that the wisest course is to leave well alone We must therefore conclude that Sir William's technique often makes a long operation—which must severely tax the patient's strength and imperil the out look—*when as much could be accomplished in a quarter* of the time or less and with proportionately less danger to the patient Sir William thinks the Harris operation ideal in some cases We must therefore conclude that he uses the Harris method of suture Considering that the prostatic cavity often measures antero posteriorly two to three or more inches I should like to know how he contrives to pick up the whole prostatic bed with a needle the bite of which is very little more than one inch Perhaps this is why the boomerang needle does not appeal to him Realizing how thin is the wall separating the prostatic cavity from the rectum I have always felt suspicious of the elaborate diagrams which show the needle passing through this wall without entering the rectal cavity I should like to know if Sir William claims to do this and if so what needle he uses If the whole prostatic bed is not taken up then it must follow that there is left a large pocket in which urine will stagnate I am inclined to think that none of the Harris technique *enthusiasts have ever* been clear on this point

Sir William states that Harris was able to eliminate haemorrhage and sepsis The cases which Mr Harris did at St Paul's Hospital proved conclusively that he did not eliminate either haemorrhage or sepsis And if Sir William feels he cannot eliminate haemorrhage and sepsis what are the advantages he claims for the operation? Sir William says he has used open suction and that he is convinced that

Medical News

The Ministry of Health states that a case of small pox (variola minor) has occurred at Ripley, Derbyshire, and the diagnosis has been confirmed by a medical officer of the Ministry The patient is an unvaccinated man of 23, who began to be ill on March 8 On March 10 the characteristic eruption of small pox appeared, and he was seen by a doctor on the following day and forthwith removed to hospital The source of the infection has not yet been determined, but the number of contacts is limited and these persons are being and will be kept under surveillance by the local authority until the expiration of the incubation period The usual facilities for vaccination and revaccination are available There are no other cases of small pox in this country at the present time

The annual meeting of the Society for the Study of Inebriety will be held at 11, Chandos Street, Cavendish Square, W, on Tuesday, April 13, at 4 p m, and will be followed by a discussion on 'The Environmental Factors in the Causation and Prevention of Alcoholism, to be opened by Dr John Y Dent

The tenth annual exhibition of the New York Physicians Art Club will be held from April 3 to 17 at the New York Academy of Medicine Further information can be obtained from the secretary, Dr Louis C Schroeder, 50, East Seventy second Street New York

The Anglo Palestinian Club has arranged an evening of medicine, magic, music and murder for members of the London Jewish Hospital Medical Society at the club premises, 43, Great Windmill Street Piccadilly, W 1, on Sunday, March 21 Mr Arnold Sorsby will take the chair at 8 30 p m, and a charge of 4s is payable at the door

The sixth French Congress of Gynaecology will be held at Toulouse from May 15 to 18, with Professor Daniel of Bucarest as president of honour and Professor Meriel of Toulouse as president The subject for discussion will be cancer of the cervix Further information can be obtained from the general secretary, M Maurice Fabre, 1 Rue Jules Lefebvre, Paris 9e

A lecture on the theory and practice of contraception will be given on April 2, at 6 p m, at the Walworth Women s Welfare Centre 153A, East Street, S E 17, followed by demonstrations on April 9, at 6 and 7 p m These are open to medical practitioners and to students who have completed their gynaecological course A fee of 5s is charged Those attending a demonstration should bring rubber gloves

The issue of the *Wiener klinische Wochenschrift* for March 5 is dedicated to Professor Julius von Wagner-Jauregg, on the occasion of his eightieth birthday on March 7, the *Wiener medizinische Wochenschrift* for March 6 contains a bibliography of his writings

Dr George R Murray Emeritus Professor of Medicine in the University of Manchester is the medical member of a Departmental Committee appointed by the Home Secretary to consider the question of compensation for card room and other workers in the cotton industry disabled by respiratory disease

Dr Axel Munthe author of *The Story of San Michele* who lives at Capri has recently given 100 000 lire to the local hospital and other sums for the erection of an almshouse and for helping the poor inhabitants of the island

Brevet Colonel Herbert John Shirley C M G T D, has been appointed a Deputy Lieutenant for the County of London

Professor Giuseppe Bastianelli director of the Institute of Malariology at Rome has been nominated president of a special committee for the study of malaria of the Health Section of the League of Nations

QUERIES AND ANSWERS

External Use of Iodine

Dr JOHN KINNEAR (Dundee) writes I agree with your correspondents that the *B P* liquor iodi mitis is irritating to many skins In the skin department for several years now I have used 1 per cent of iodine dissolved in carbon tetrachloride and it is also used by several of the surgeons in Dundee Royal Infirmary This preparation is entirely satisfactory and non irritating With regard to first aid application to wounds I advise plain spirit either methylated or surgical and find that the percentage of cases showing signs of sepsis is much less than with iodine

Broken Sleep in Middle Age

SUSSEX asks for suggestions for treatment of early morning wakening in a busy professional man of about 50 The patient otherwise well can sleep from about 11 p m till 3 or 4 a m after which his rest is much broken the result being that he is heavy and drowsy in the afternoon and evening following The usual things have been tried—a hot drink on going to bed a hot drink biscuits alkalis on waking The blood pressure is low—systolic 108 mm Would a prolonged course of sedatives be justifiable in a case like this? The man s efficiency is being impaired by his continued broken sleep The condition has grown gradually over a period of years

Infra red Ray Apparatus

Dr S J HIGGINS (Kinnerley Oswestry) writes Can any reader recommend from practical experience a small reliable apparatus for infra red ray treatment which can be run off a private domestic electric light circuit of 110 volts?

Income Tax

Liability of Retiring Partner

X explains that A B and C have been in partnership and as from January 1 1937 A has sold his share to D following a three months introduction period during which D was paid as an assistant As from January 1 1937 all earnings will be for the credit of B C and D but receipts from previous work will go to A B and C What will be A s liability for 1936-7 and subsequent years?

*** A s income from the practice ceases as from January 1 1937 and subsequent receipts represent capital in his hands—that is the ingathering of cash for earnings on which he has already paid tax (The cash basis is merely a convenient way of measuring the gross income of any particular year) His income tax liability for 1936-7 will therefore be in respect of three fourths of the amount already agreed for that year and D will be liable to account for tax on the remaining quarter in addition of course to his salary as an assistant for the three months

'suction has diminished the incidence of post operative haemorrhage" Surely this is illogical, to say the least of it

Sir William ends his letter by quoting a fellow practitioner as saying that the surgeon who is never in doubt is invariably wrong It seems to me that the surgeon who is always in doubt and who cannot separate the good from the bad is rather a danger to the community than otherwise —I am, etc,

London, W 1, March 13 W K IRWIN

Cancer of the Breast

SIR —In his letter of February 27 (*Journal*, p 471) Mr Sampson Handley has failed to appreciate my expression of indebtedness to him for suggestions on the use of radium, which, if like many others they failed to fulfil expectations, were useful at the time Not only does he regard my tribute to Mr G Keynes as hostile to himself but criticizes a letter in which I did not even refer to the theory of permeation and has taken me to task for differing from his views on that theory A theory is not a proven fact, it is not even a truth, and presupposes that more than one hypothesis is possible

The slides which he used to exhibit to emphasize his views in my opinion only showed where the cells were at the time the slides were cut How the cells reach their position—whether, as he thinks, by continuous growth along the lymphatic in which ninety-nine out of a hundred cells disappear, or, as I suggest, by the ordinary process of embolism along the lymphatics—is a matter of opinion My view on the subject was expressed in the *British Journal of Surgery* (April, 1925), and followed a similar criticism by a more distinguished man, Sir James Beatson, in the preceding number of the same journal My view, therefore, is certainly not singular and can scarcely be regarded as unreasonable

The possibility of dissemination of carcinoma by the blood stream has been so fully established by the efforts of innumerable pathologists that most textbooks include illustrations of veins being invaded by growth The importance of this in explaining clinical problems has not yet been fully recognized and is to some extent new, and perhaps its teaching may not yet be considered orthodox by those brought up to think otherwise Mr Sampson Handley considers that blood dissemination "is late, and in a majority of cases there is no evidence that it occurs at all" He is fully entitled to this view, but what about rectal carcinoma? Would anyone nowadays attempt a wide operation for its removal without first examining the liver? Does Mr Sampson Handley consider that the metastases so commonly met there are also due to permeation of the lymphatics and not accounted for by embolism along the portal blood stream? I need hardly remind him there is no direct lymphatic connexion while there is a direct circulatory one

While naturally admitting the commonly recognized lymphatic spread, I believe that in every part of the body the dissemination of carcinoma is probably much the same, and I cite rectal carcinoma as an illustration of the undoubted circulatory spread which is not so widely recognized I am credited with being the author of the saying that the average life of 'a truth' is twenty years" I was unaware of it, but bow my acknowledgements At the risk of being accused of bad taste I would suggest that this attitude of mind is at least as old as Pontius Pilate and is a commonplace of science to-day From my experience the saying contains more truth and less nonsense than many other better-known medical aphorisms

I hope that many of the views expressed in my book of 1924, quoted by Mr Sampson Handley, are by now out of date, but would respectfully remind him that his own book is two years older He also takes exception to my stating that we have at present no great hopes from the action of radium in inaccessible carcinoma This statement is prompted by a considerable experience of such cases treated by radium, occasionally with unexpected good results, which, however, have ceased to make me optimistic This statement, I believe, embodies the view reluctantly arrived at by most, if not all, of those engaged in this work This of course does not turn the view into a truth At one time we had other hopes Our views may change again, let us hope they will If Mr Sampson Handley still holds other views on the subject I can assure him I am not, and I hope I never shall be, perturbed at differences of opinion, and I hope he will continue to reciprocate this feeling We shall never all think alike——I am, etc,

London, W 1, March 8 DUNCAN C L FITZWILLIAMS

Vegetable Diet for Children

SIR,—I was greatly interested in the annotation in the *Journal* for March 13 on the rearing of twins on a vegetable diet I have long advocated that cow's milk is not only unnecessary for children but definitely harmful Sensitivity to cow's milk occurs more frequently than to any other food and is a causative factor in the overgrowth of lymphoid tissue, as shown by enlarged tonsils and adenoids, catarrhal conditions, and asthmatic eczema I have proved in many cases that children fed in the way described in the annotation are immune from the so called childish ailments, and the matter was dealt with in medical literature some ten years ago The asthmatic child does very badly on a milk diet as would be expected from what I have already said, yet it frequently forms the chief item of food

The annotation goes on to mention the "conventional mixed diet containing cow's milk," and the word "conventional" is well chosen, for it is not rational nor are the benefits of such a diet borne out by clinical evidence True, some children put on weight on such a diet but in my own practice I have repeatedly seen emaciated asthmatic children increase in body weight immediately milk was omitted from the diet and adjustments made as described in your annotation Mention of "almond fac" is interesting and important, and its high vitamin B content would be of the greatest value —I am, etc,

London, W 1, March 12 F T HARRINGTON

Psychological Factors in Rheumatism

SIR,—I had hoped that Dr J L Halliday's valuable and instructive articles (*Journal* January 30, p 213, and February 6, p 264) would have evoked an interesting correspondence, but Dr James Cook's letter (March 6, p 529) was the sole response to Dr Halliday's communications Apparently Dr James Cook has never heard of "the psychological approach" in the investigation of "physical" illness in any case Many believe that it is by no means synonymous with psycho analysis or with "the bedside manner" Referring to Dr Halliday's most interesting articles I was surprised that he does not appear to have read any of the works of Dr Alfred Adler, who first formulated the doctrine of "organ inferiority" I would suggest that Dr Georg Groddeck has borrowed some of his ideas from Dr Adler's works and has reclothed them in language of his own

Considering Dr James Cook's criticism of Dr Halliday's articles one is tempted to inquire whether absence of

[illegible] be liable to tax in respect of any receipts from [illegible] for 1937-8. It may perhaps be advisable to add that A, B, and D can if all agree to do so require the change in tax liability to be calculated as if the practice had ceased on December 31, 1936, and a new one started on January 1, 1937, but it would involve a change to the cash basis, cause a good deal of trouble, and probably lead to a very similar result.

Sale of Practice with Introduction

"Tax" writes: "A sold his practice to B with effect on November 1, 1936, with a twenty days introduction. B paid A for ten days being half the total proceeds for twenty days. The income tax inspector wants to know how much A received, and will presumably tax A on that amount, but refuses to deduct the amount from B and so will obtain tax twice over. Is this legal?

*** We do not see any grounds on which tax can be required from both B and A on the same sum. Up to November 1, 1936, A was assessable for the profits of the practice, and anything he paid B for services prior to that date would be an expense incurred by A in carrying on the practice and therefore deductible in calculating his income tax liability; after the change in proprietorship on that date the position as regards A and B is precisely reversed, and B is entitled to deduct as an expense sums payable by him for assistance rendered by A. It is just possible that the inspector may be intending to treat the period of introduction as one of partnership, in our view that is incorrect, but if consistently applied the difference in result would be immaterial.

Retirement from Partnership

"B" is a partner in general practice and intends to retire on September 30 and take a six-months post-graduate course. The firm's accounts are made up to March 31 each year. What will be his liability?

*** Assuming that "B's" share of the profits for the year to March 31, 1937, as calculated for income tax purposes would be £x, he will be liable to account for tax for 1937-8 on half £x only. His liability for 1936-7 will not be affected unless all partners concerned join in requiring the liabilities of the old and new firms to be dealt with as if the change involved the setting up of a new practice, and such a requirement causes a good deal of trouble for problematical gain.

LETTERS, NOTES, ETC

International Congress on Leprosy: Cairo, 1938

CORRECTION

A news paragraph in last week's *Journal* stated that the fourth International Congress on Leprosy will be held in Cairo on March 21. We are asked by Dr E. Muir, general secretary-treasurer of the International Leprosy Association, who is also secretary of the Cairo Congress, to correct this announcement. The Congress will begin on March 21, *1938*, not 1937.

Wax Solvents

Mr ST GEORGE B. DELISLE GRAY writes: An ear full of wax can be cleared out without the slightest difficulty by means of the following technique. Instruct the patient to fill both "ear holes" at night with warm sweet almond or olive oil. Heat a teaspoon and half fill with the oil, turn the head to one side and pour into the ear. When the ear hole is full insert a small loose plug of cotton-wool so as to prevent the oil running out on to the pillow. Repeat the process in the morning before visiting the doctor. Both ears must be treated, as there is nearly always wax in both. Syringe the ears *hard* with a solution of bicarbonate of soda in water as warm as the patient can stand with comfort. The alkaline solution forms a soap with the oil and the softened plug of wax slips out usually in one piece. Always show it to the patient. He will not wait so long before having his ears syringed when he sees what a *lot* of wax he has in them. Always examine the ear with a speculum before beginning this treatment to make sure that there is wax, and examine after syringing to make sure that all the wax has been removed. If the patient is suspected or known to have a perforation of the drum the wax should not be removed by syringing, but may be scooped away after softening with oil as above. This is done with a small blunt curette under direct vision through an aural speculum. With an electric auriscope this presents no difficulty.

Frauds on Doctors

Mr HAMILTON BAILEY (London, W.) writes: It has been brought to my notice from several sources that a gentleman impersonating me is calling upon members of the medical profession and others requesting a loan of ten shillings for a taxi fare. It would save me much embarrassment if the next doctor to whom he makes this request would kindly communicate with the police.

Dr ALEXANDER WILSON (Putney Hill, S.W.15) informs us that a man recently brought a parcel to his door bearing a Post Office C.O.D. label addressed to Dr. A. Wilson and marked 'Urgent. For Special Delivery, Thursday 11/3/37. From —— Ltd., Wigmore Street, W.1, 7/6 to pay.' The maid brought the parcel to Dr. Wilson's secretary, thinking that he must have ordered a book she gave the money to the maid to pay the messenger. No book had, however, been ordered, and the name of the firm does not appear in the Telephone Directory or in the Post Office London Directory. The parcel contained a non-medical book published in 1931, not apparently a new copy.

Dr J. H. DOUGLAS WEBSTER writes: You very kindly put a warning note in your issue of January 23 (p. 202) about an impersonator of me who is still actively continuing his extortions. For example, owing to your notice having been seen, he was suspected on Thursday at Lewis's Library, but while they were telephoning to me he vanished, on Friday he attempted to cash a cheque (forging my name) at Burroughs Wellcome's, on Tuesday he borrowed 10s. from Mr. Stanley Cox (electrical apparatus manufacturers). Practically every day I am rung up by persons whom he has taken in or attempted to impose on in my name (druggists, tobacconists, etc.). Perhaps a brief further notice might help the police to catch this imposter through someone suspecting him in the act and detaining him.

A Warning

Mr NORMAN HAIRE, Ch.M., writes: As I have just received through the post a circular from the London office of a German firm advertising a paste which they are introducing into this country, to be injected into the uterus to interrupt pregnancy, I feel that I should hasten to warn the medical profession of the dangers of the form in which it is presented. The firm in question puts the paste up in a tube like a tooth paste tube to which is attached a nozzle with a cannula through which the paste is injected into the uterus. The tube is opaque, so that it is impossible to see what condition the contents of the tube are in. In the past in other countries deaths have occurred from the use of paste in such tubes. Some of the deaths have been attributed to changes in the paste brought about by chemical action between the constituents of the paste and the material of which the tube itself is composed. Others have been attributed to air embolism arising from bubbles of air ejected from the tube into the uterus. As the tube is opaque such air bubbles cannot be detected. The particulars given in the circular are misleading and likely to lead to disaster. Contrary to what is claimed, the method *is* a surgical operation, there *is* reason to fear infection unless it is carried out as a surgical operation, and the need for narcosis is *not* eliminated. In cases where interruption of pregnancy is medically indicated it may very well be carried out by the use of such a paste, but this should be put up in glass containers to one end of which a plunger and to the other end a nozzle and cannula are attachable. Thus the surgeon can see the condition of the paste and eliminate the possibility of injecting air bubbles. The method should only be used by a skilled gynaecologist, and only in a hospital or nursing home—*never* in an ambulant patient or without an anaesthetic.

"Patient, Nurse, and Hospital"

The review under this heading of Miss Florence Fidler's book, *The Patient Looks at the Hospital* (February 27, p. 447), included two passages within quotation marks. In the first of these the words "mean, petty" should have been "petty, mean." The second passage was a paraphrase, and should not have appeared within quotation marks. The author's words with reference to ex-patients among working class women are:

> "Though resentful, their principal thought is always that they must not 'upset' the hospital because as paid patients they may have to go there again, and they know by their own and by their friends' experience that unless they at all times express the correct amount of gratitude demanded, it may be held up against them in the future."

subsequent complaint is always to be regarded as evidence of "cure" In 1926 I had a profoundly depressed and very emaciated patient who had been for twelve days a "voluntary boarder" in a mental hospital When convalescent the patient against advice, went down to a remote country district in the depth of winter Isolation induced a return of his symptoms he called in the local doctor, who was displeased, apparently, at the prospect of having to listen to a long history of symptoms—most real to the patient, but infinitely boring to an uninterested and unsympathetic hearer The doctor cut short the story by saying brusquely, Oh, you must pull yourself together! We don't believe in *nerves* down here The patient did not send for the doctor again but the reason was not that he was 'cured' One has heard of an eminent surgeon who many years ago introduced the procedure of 'tunnelling' the hypertrophied prostate either *with a Lister's sound or a metal catheter* The surgeon descanted upon the simplicity of the operation, which "completely cures the patient—at all events, I never see him again!" It was suggested by a colleague that the patient's failure to return might be due to other reasons than that of 'complete cure.' —I am, etc,

London W1 March 15 C W J BRASHER

SIR,—To rid Dr T A Ross of his 'unpleasant thoughts' I would remind him that what he regards as 'punishment' in a prison population are luxuries beyond the reach of thousands of his law abiding fellow citizens —I am, etc,

Glasgow March 13 JAMES COOK

Death following Blood Transfusion

SIR,—Dr F Pygott, in the *Journal* of March 6 (p 496) rightly stresses again the very real danger of death from pulmonary oedema following blood transfusion, but surely we have better methods of prevention than a rather paradoxical prophylactic venesection

An injection of morphine and atropine—the recognized specific against pulmonary oedema—should be given as a routine measure fifteen minutes before the transfusion and repeated at the first sign of danger (cough, dyspnoea, etc) This simple precaution will also keep the patient calm during the whole procedure, which must on no account be hurried It is of the utmost importance to introduce the blood very slowly with occasional pauses, especially when there has been no acute haemorrhage and when the myocardium is likely to have suffered The rate of transfusion should be recorded in every case—I am, etc,

London W1 March 6 F E LOEWY

SIR,—In his interesting account of two fatal cases in the *Journal* of March 6 Dr Pygott states that in the group to which those cases belonged "there is "a cardiovascular system which has been injured to a greater or less degree the amount of humoral fluid is at least normal To this system we add a strain in the shape of an increase in blood volume, and thus place an extra load upon an organ which is relatively inefficient'

This explanation as to the cause of death in these cases appears to fit in with the observed facts and may be correct But Dr Pygott suggests that there are only two alternatives which can be adopted to avoid this mechanical strain on the heart (1) venesection before transfusion, and (2) frequent small transfusions which are often a nuisance to both patient and doctor and are naturally of very much less therapeutic value

I venture to suggest that there is a third alternative, the drip transfusion method described by H L Marriott and A Kekwick By this method as much as eleven pints have been given to a patient, but the transfusion can be given as slowly as forty drops a minute which raises the haemoglobin percentage by ten every four hours At this rate of flow it is unlikely that the patient's injured cardiovascular system' would be embarrassed, but Marriott and Kekwick state (*Proc Roy Soc Med* 1936, *29*, 9) that in patients in a weak condition or in the subjects of cardiovascular disease it is safer to raise the haemoglobin in stages by 30 per cent at a time with an interval of three or four days between each stage It is difficult to see why this procedure should be naturally of very much less therapeutic value Indeed, experience has proved it to be the opposite—I am, etc,

Shanklin I W March 9 H S HOWIE WOOD

A Clot in the Cannula

SIR,—In the *Journal* of February 20 (p 417) Mr W E Cooke raises the question of embolism as a possible danger in the use of the intravenous trocar and cannula described in an earlier issue (January 23, p 173)

I would point out that any clot which obstructs this cannula is small, but manipulation of the trocar within a vein compresses the clot into the cannula fenestrations The resultant gush of blood tends to wash out the cannula, removing this clot Normally the flow from the cannula is rapid (I have often obtained 500 c.cm of blood in three minutes) and clotting is rare I think the danger of embolism from the use of this instrument is very remote—I am etc,

London W2 March 6 REGINALD A KING

Radiograph or Skiagram

SIR—If the *Oxford Dictionary* defines a radiograph as "an impression or image of an object produced on a sensitive plate by means of the Rontgen rays (*Journal* March 6 p 530) I make bold to state that the definition is an imperfect one and that it should read 'an impression of the *shadow* of an object etc, because of course, the Rontgen rays do not produce an image but cast a shadow the outlines of which are impressed on the sensitive plate or film

This immediately suggests the word skiagram' for what is popularly known as an x ray photograph,' in preference to the word 'radiograph,' which as your correspondent Mr Boulton Myles states is by no means an ideal word A better word would be very acceptable The word 'skiagram' is already in use in many parts of the world it is etymologically correct (literally, shadow tracing), and it could not in any circumstances be confused with a radio telegram a radiogramophone or 'an instrument for recording intensity or duration of sunshine' In any case I should be surprised if what is now generally called an x ray photograph is not still generally called an x ray photograph (or more simply an x ray) by the public and the majority of the medical profession in twenty years time However, if a crusade is to be undertaken for the use of a more elegant term I suggest that skiagram is the word which should be adopted—I am etc

Stourbridge Worcs March 9 R S LAWSON M S

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

210 Agnstric Anaemias

K BLUM (*Zbl Chir*, January 30 1937, p 279) reviews the rare cases of agastric anaemia recorded in the literature In most cases the patients had undergone resection of the stomach for carcinoma or peptic ulcer In one case atrophy of the stomach took place following the ingestion of zinc chloride The common form of anaemia was of the pernicious type In other cases that of the aplastic type was noted Blum adds the histories of three young women under his care who had undergone resection of the stomach for peptic ulcer without haemop tysis All three recovered slowly from the operation and complained of menorrhagia after it Five years after wards they presented a blood picture of a hypochromic anaemia with a low colour index Recovery took place only after the administration of iron and pancreatic extract alternated with stomach extract Blum believes that his cases have nothing to do with pernicious anaemia, and that in general pernicious anaemia and agastric anaemia are nosologically two completely different types Agastric anaemia is due, according to Blum to a dis turbance of the iron metabolism There is experimental evidence that iron absorption depends on the gastric acidity When the patient is agastric, absorption of iron is lowered and after a period of years the iron reserve in the body is no longer adequate to maintain the haemo globin content of the blood The part played by bacteria toxins, and endocrine factors in the production of agastric anaemia cannot be assessed The author believes the prognosis of the condition to be good provided that patients remain under continual treatment with iron com bined with pancreatic extract In iron free intervals administration of stomach extract and hydrochloric acid is essential In severe cases blood transfusion may be required

211 Sternal Puncture

H FLEISCHHACKER and R KLIMA (*Munch med Wschr* December 11, 1936, p 2051) state that with the help of sternal puncture it is possible to recognize changes in the haemopoietic system which cannot be diagnosed by investigation of the peripheral blood or other measures In most cases it is easy to aspirate marrow from the sternum and the material is often rich in cells giving a clue to the diagnosis They describe in detail two cases of Gaucher s disease and eight of secondary deposits from occult neoplasms thus diagnosed When tumour cells are present they can be easily recognized if the morphology of marrow cells is known The tumour cells are differ- entiated by their size, their immaturity, the occurrence of degenerative forms and mitosis The cells show definite morphological characteristics which with increasing experience may in the future be helpful in establishing the differential diagnosis of the primary neoplasm

212 Influenza in Berlin

H DENNIG (*Dtsch med Wschr*, January 29, 1937, p 178) finds that this winter s epidemic of influenza in Berlin presents all the features of the pandemic of 1918, the severity of which has not yet been equalled The present epidemic is characterized by certain distinctive features While the gastro intestinal form is very rare, disturbances of the nervous system are remarkably common and Pro- fessor Dennig believes that involvement of the central nervous system and its membranes is far more common than is generally suspected Almost invariably when severe headache led to lumbar puncture either an increase of intraspinal pressure or of the number of cells in the cerebro spinal fluid or both these phenomena were found In almost every case the first symptoms were referred to the upper respiratory tract, from nasopharynx to trachea In most cases as judged by these symptoms there was no extension of the infection beyond this area The fever conformed to no special type it often began suddenly with an attack of shivering, and in one to five days there would be a fall by lysis A very common sequel was a renewed attack of fever beginning about the eighth day of the disease Usually these relapses lasted only a day or two, and they seemed often to be independent of such indiscretions as premature quitting of bed or house, for they often overtook patients who had remained in bed all the time Hitherto genuine bronchitis, so common in earlier epidemics, has been conspicuous by its absence the involvement of the respiratory tract hardly ever exceeding a mild tracheitis Though in most cases a violent headache was not regarded as an indication for lumbar puncture drugs being sufficient for the relief of symptoms Professor Dennig considers that it is better to risk overdoing lumbar puncture than to neglect it when severe headache is associated with drowsiness With regard to the alleged abortive and curative actions of quinine, salicylates, etc, he is profoundly sceptical, and he has seen many a patient contract influenza in spite of daily prophylactic medication with quinine

Surgery

213 Brachial Plexus Injuries

A BONOLA (*Chir Organi Mov* October, 1936 p 309) draws attention to the frequency of brachial plexus palsies after motor cycle accidents, which have accounted for ten of thirty-two traumatic cases at Bologna in the present century [DEMMER in the *Wien med Wschr* (1929 p 642) appears to be the only observer who has previously noted this] The lesions result from an extremely swift displacement of the shoulder downwards and backwards by force striking its antero superior part It is well known that in experimental reproduction of such a movement the fifth and sixth cervical roots are tense, while the eighth cervical and first dorsal remain flaccid This is in accordance with Bonola's findings for in his series the seventh and eighth cervical and first dorsal were infre quently affected, and then in their secondary trunks In total complete palsies, affecting all the cords and the roots of the fifth cervical to the first dorsal, the miosis enophthalmos syndrome of cervical sympathetic paralysis was present Diagnosis was dependent on clinical examination and electrical tests, and at operation was difficult or impossible—these cases coming to treatment months or years after the accident—because the nerve trunks and roots were matted in scar tissue Only three cases showed ultimate improvement, and of these two had been treated by non operative measures only Causalgia in one case was so severe as to justify amputation Bonola as a result of his survey of operative difficulties and end results is heartily in agreement with those who recommend immediate operation (that is within a few days) for brachial plexus tearings neurological diagnosis is now more speedy and the ultimate results of expectant treatment are far from encouraging

214 Purulent Tendo vaginitis

H S NISSEN LIE (*Norsk Mag Laegevidensk* January 1 1937 p 41) has examined about a year after discharge the sixteen survivors of the seventeen patients treated for purulent tendo vaginitis at the Ullevaal Hospital in Oslo in the course of two years The comparative rarity of

Obituary

R G RIDDELL, M D, F R C S Ed,
Consulting Surgeon, Torbay Hospital

The death of Dr Robert George Riddell on March 6 has robbed Torquay of a senior practitioner esteemed and beloved alike by patients and colleagues He was educated at Edinburgh, and took not only his M D degree but also the F R C S Ed After Edinburgh he did hospital appointments in Birkenhead, and then moved to Rotherham, where he practised for over twenty years, and was first president of the Rotherham Rotary Club It was in 1923 that Dr Riddell first came to Torquay, and he later was elected surgeon to the Torbay Hospital, which appointment he resigned on account of the age limit two years ago He had always a kindly, tolerant, and Christian outlook on life, and possessed high ideals as to the duties of medical men to colleagues and to the community Dr Riddell occupied an outstanding position in the Torquay Medical Society and the Torquay Division of the British Medical Association, of which he was chairman in 1928 He was universally popular, and everyone listened with respect and attention to his wise and common-sense advice As a surgeon he achieved a high local reputation, and continued to do good and reliable work even after a serious illness a few years ago He believed it to be the duty of a doctor to take part in all kinds of public activities that were for the good of the community, but could never bring himself under any circumstances to say an unkind word about anyone The Torquay profession mourns a great loss, and extends heartfelt sympathy to the bereaved family

The late Dr ALBERT SOPHRON SIEGER, port medical officer and inspector of aliens at Glasgow, was born in 1875 at Greenock He entered the University of Glasgow and took the triple qualification L R C P, L R C S Ed, L R F P S Glas in 1899, and four years later obtained the Glasgow D P H After a short time in general practice he was appointed civil surgeon to the military hospital at Devonport, and was then attached to the South African Field Force from 1899 to 1902, after which he returned to this country to take up public health work In December, 1903, he joined the Glasgow Port Local Authority as assistant port medical officer, and was later promoted to the senior post In 1914 he was attached at the outbreak of the war to the staff of Ruchill Fever Hospital, and was later superintendent of Shieldhall Fever Hospital Towards the close of 1915 he obtained a commission in the R A M C and served in Malta and Alexandria In 1919 he resumed his duties with the Port of Glasgow Authority, and in the following year became inspector of aliens He was a Fellow of the Royal Institute of Public Health and an active member of the Association of Port Sanitary Officers, being much engaged at the time of his death with the coming annual meeting of the latter organization Dr Sieger joined the British Medical Association in 1921, and was very popular with all his colleagues, having many friends in shipping circles He leaves a widow and three children

Dr JOHN LIDDELL, formerly of Harrogate, died at Mont Estoril, Portugal, on February 28, after being ill for less than two days from a failing heart He obtained his M B and C M degrees at Edinburgh University in 1882, and proceeded M D with honours in 1890 As a young man he had a knowledge of pathological and bacteriological technique which was uncommon at that time, and his medical colleagues in Winchester, where he eventually settled in practice, sought his skill and aid in affairs which, novelties then, are routine nowadays In 1891 he moved to the more bracing climate of Harrogate, where he was to spend nearly the next forty years of his life He was appointed honorary physician to the Royal Bath Hospital and to the Sunderland Infirmary's convalescent home, and wrote on the spa waters of Harrogate and their effect in diseases of the skin, as well as in all that is comprised under the title of "rheumatism" He was a keen member of the Dermatological Society and studied dermatological conditions with the microtome and microscope in his own laboratory at home, there being then no other adequate accommodation He was specially interested in and successful with cases of rheumatoid arthritis Some years later he introduced to Harrogate the Plombières system of colon irrigation, and it is now well established there as a valuable resource in spa treatment Dr Liddell joined the British Medical Association in 1884 Always an ardent golfer, he was vice president of the Harrogate Club the day of his death, and had been a foundation member in humble early days of the club Retiring in 1929, and being fond of the sea, he travelled for some years, though returning to Harrogate at regular intervals for a course of the treatment of which his own person was so excellent a recommendation Only last year he had settled down in Wiltshire, at Highworth The burial was in the British cemetery at Lisbon

We regret to record the untimely death of Dr ISOBELLA MACINDOE MALCOLM AITKEN on January 29, only five weeks after she had taken up duty with the Livingstonia Mission at Bandawe on Lake Shore, Nyasaland After receiving her medical education at Edinburgh where she had graduated M B, Ch B in 1920, she obtained the D P H Ed and Glasg in the following year, and began to specialize in public health, maternity, and child welfare work shortly afterwards She had held the appointments of obstetrical house surgeon at the Elsie Inglis Memorial Maternity Hospital, Edinburgh, senior house physician to the Royal Hospital for Sick Children, Edinburgh, and junior house surgeon to the Roby Street branch of the Royal Infirmary, Manchester Going out to West Africa she joined the staff of the health department of the Gold Coast Medical Service in 1928 and was seconded four years later from there to Nyasaland With her previous experience of hospital work, first on the Gold Coast and latterly at Fort Johnston she was a most welcome recruit to the medical staff of the Livingstonia Mission, where she had proposed to develop child welfare work in the Chinteche district in addition to her duties in connexion with the lepers and the Mission Hospital at Bandawe Her death after a short illness was indirectly due to cerebral malaria Dr Aitken was a Fellow of the Royal Society of Tropical Medicine and had taken great interest in tropical diseases she published a note on infantile trypanosomiasis in 1931 in the *West African Medical Journal* She joined the British Medical Association in 1921

Dr PETER LIN YANG, F R C P I, who has died in Hong Kong Government Hospital as the result of an accident, was well known in medical circles in Ireland, where he did post-graduate work for six years He was house surgeon for a year at Steevens's Hospital, Dublin, and also studied in Edinburgh and the United States He went back to Hong Kong two years ago and took up the assistant professorship of obstetrics and gynecology in the University He joined the British Medical Association immediately after graduating M B, B S in 1929

The death is announced of Dr LEON GERNEZ who was at the head of the anti-cancer centre of the Tenon Hospital in Paris It was not till comparatively late in life that he passed from a varied field in operative surgery to specialization in cancer work

purulent tendo-vaginitis following whitlows is indicated by the fact that in the period under review some 6,000 surgical cases were treated in this hospital In only five of the seventeen cases was the origin of the tendo-vaginitis primary in the sense that a direct lesion had involved the tendon sheaths (deep cuts or punctures by wires) In the remaining twelve cases the tendo vaginitis was a sequel to a subcutaneous whitlow and could conceivably have been averted by rational treatment from the outset All these patients had been treated by incisions, once or oftener, before admission to hospital, but this had not sufficed to avert the extension of the infection to the tendon sheaths In as many as five cases the signs of tendo-vaginitis appeared as a direct sequel to an incision, presumably because it had been too deep, and thus had infected the sheaths The average interval between the injury and admission to hospital was six days, the average duration of residence in hospital was forty days and of invalidism five months None of the six patients with involvement of one of the three middle fingers succeeded in retaining a useful finger Only one patient regained complete freedom of movement of all his fingers, and one patient died of pulmonary embolism after the infection had spread extensively and pyarthrosis had developed in one wrist In all the other cases some degree of usefulness, though not complete freedom of movement, was restored to the hands The author concludes that spontaneous recovery is rare when a whitlow is deep, and that neither hot fomentations nor timid incisions will avert complications, for the only path the inflammation can follow is that leading to tendon sheaths periosteum, or joints Only when the infection is under control and the temperature has fallen to normal should active movements of the parts involved be encouraged

215 Fractures of the Neck of the Femur

A BORCHARD (*Dtsch med Wschr* January 8, 1937, p 45) discusses the comparative merits of the conservative and operative treatment of fractures of the neck of the femur in the light of his experience with 114 such cases treated since October 1934, in a Berlin hospital The patients were recruited from a very poor milieu, and their reserves of vitality were very small The average age was between 70 and 71 The author found none of the modern operative measures indicated in these cases, and the choice lay between plaster-of-Paris immobilization on Whitman's principles and extension The first entailed a preliminary reposition, requiring some form of anaesthesia, or extension with the object of paving the way to satisfactory plaster immobilization Anaesthesia was not considered desirable There remained reposition by extension, and this preliminary to plaster immobilization proved so satisfactory that the author was tempted to maintain the extension as the permanent system of treatment in the place of plaster immobilization For this, even when skilfully practised and with effective padding, does not entirely eliminate the risk of bedsores in elderly patients A further objection to plaster is the embarrassment of the respiration its employment may entail Lastly, plaster is apt to delay the necessary functional treatment at a later stage When there is no displacement treatment may be safely limited to a comfortable posture which does not prevent the patient from sitting up and receiving massage Such conservative treatment is also indicated when the patient has already been bed-ridden In all other cases the old-fashioned treatment by extension gives the best results After eight weeks the author reduces the pull of the extension and his decision when to discontinue it is not guided by radiography, but by the simple test of rotating the limb If the head of the femur follows all the movements of the limb freely the extension may be discontinued and a fortnight later passive movements may be instituted The mortality in the author's material was 25 per cent, and 50 per cent could walk again with or without a stick Bad results had to be admitted in 25 per cent

Therapeutics

216 Migraine

F BRUNN (*Med Klinik* January 20, 1937, p 120) has experimented with a number of treatments in cases of migraine A salt-free diet proved valueless, as did intravenous injections of magnesium sulphate A modified Wagner-Jauregg diet gave good results He forbade all sweetened food, bread, and cakes, but allowed any other food in unrestricted quantities, except in cases of adiposity On this diet the patient loses weight, but it can be applied without harm even in lean persons

217 Insulin Shock in Schizophrenia

According to A V BRAUNMUHL (*Munch med Wschr*, January 1, 1937, p 8) the treatment of schizophrenia with insulin shock is attended by success in many cases In the first phase of the treatment the patient receives increasing doses of insulin until a hypoglycaemic state is induced The initial dose is 10 to 20 units Deep intramuscular injections are given at four-hourly intervals, and each day the dosage is increased by 4 to 8 units The first phase lasts fourteen days The second or "shock phase" lasts one-half to two and a quarter hours, and the patient is comatose The symptomatology of this phase is described in detail by the author The second phase is terminated at will by the administration of 180 to 200 grammes of glucose in three quarters of a litre of water or tea Tachycardia and other arrhythmias, aspiration pneumonia, and cranial disturbances may call for the cessation of the shock treatment A mortality of 1 3 per cent is recorded A complete anti-shock apparatus is held in readiness for use by the physician, whose duty it is to be available at an instant's notice Patients rarely resist the injections they sometimes complain of headache and muscular pain, of nausea and hypoglycaemic vomiting Of the "shock phase" there is no remembrance The psychological effect is said to be remarkable A cure may be expected in 70 per cent of early cases—that is, of six months' duration or less In old standing cases 45 per cent may be expected to improve

218 Graves's Disease

H RASMUSSEN (*Acta med scand* 1937, vol 91, Fasc 1–11, p 69) has conducted follow-up studies in connexion with the ninety-eight cases (only five males) of Graves's disease treated at the municipal hospital in Bergen during the ten years beginning in the spring of 1924 Data concerning eighty-two of these patients were collected after an average interval of four to five years after discharge The patients, whose treatment was limited to strict rest in bed, a vegetarian diet, and drugs, including sedatives and iodine, represented on the whole comparatively mild cases The immediate results of this treatment, with or without iodine, were in some cases remarkably good, and on re-examination about one-third were found to be free from signs of thyrotoxicosis But most of these patients were still subject to psychoneurotic symptoms, which sometimes greatly interfered with their working capacity, and only three or four of all the patients given conservative treatment could be considered as cured Of the forty-one patients treated by thyroidectomy about 70 per cent were found to be cured of their thyrotoxicosis, but only five or six could be said to be completely free from psychoneurotic symptoms Permanent hypothyroidism or myxoedema was found in six cases and tetany in two Paralysis of the recurrent laryngeal nerve was found in four cases and in others there were minor troubles interfering with swallowing Four of these forty-one patients had died soon after the operation, and two other deaths must be considered as late post-operative sequels The radiologically treated cases numbered only ten, in eight of which no signs of thyrotoxicosis could be found on re-

Universities and Colleges

UNIVERSITY OF OXFORD

Diploma in Ophthalmology

The Board of the Faculty of Medicine has made the following changes in the regulations which will come into force on October 1

Regulation 6 (ii) Examination Statutes 1936 p 316 will read A certificate showing that the candidate has satisfactorily attended in the University of Oxford a course of instruction in the anatomy of the eye and its appendages including the development and minute structure of these parts

Regulation 6 (iii) will read A certificate showing that the candidate has satisfactorily attended in the University of Oxford a course of instruction in physiological optics and in the physiology of vision

Regulation 6 (iv) for duly substitute satisfactorily

The last sentence of the first note to the form of certificate 1 (p 317) shall read Two months of the period may run concurrently with the necessary courses at Oxford and the Registrar may provisionally accept when a candidate enters his name a certificate for such concurrent period of two months subject to confirmation at the end of the period

Certificate 2 lines 3–5 (p 317) will read satisfactorily attended in the University of Oxford a course of instruction in the anatomy of the eye and its appendages including the development and minute structure of these parts

Certificate 3 lines 3 and 4 (p 317) will read satisfactorily attended in the University of Oxford a course of instruction in physiological optics and in the physiology of vision

Certificate 4 lines 3 and 4 (p 318) will read satisfactorily attended a course of ophthalmology in the University of Oxford for a period of at least two months

And the following note will be added The Registrar may provisionally accept when a candidate enters his name a certificate for the whole two months subject to confirmation at the end of the course

UNIVERSITY OF CAMBRIDGE

At a congregation held on March 12 the following medical degrees were conferred

M D—D W Smithers

M CHIR—W H G Jessop

M B B CHIR—*F G Hinks *F B Thomas B L Williams *A Rothwell *D G Fre hwater *W J Montague C S Humphries A D Ledward N D Jekyll V C Robinson E G K Williams G I Watson I C Fletcher B C M Palmer E O Walker, G L Broderick H D Johnson G S W Orgine A M McFarlan R G M Keeling F D M Livingstone

M B—*S J R Reynolds *W G Brander, *L T Hilliard *J H Stothert *T S R Fisher *W M Beattie J C Newbold J Diver J R Chambers H S Wigfield C G Batty Smith C McNeil T C Larkworthy C J Martin F G A Beckett

* By proxy

UNIVERSITY OF MANCHESTER

A special meeting of the University Court on March 10 gave authority to confer the honorary degree of D Sc on Sir Henry Hallett Dale C B E M D, F R C P F R S Nobel Laureate Director of the National Institute for Medical Research Hampstead It is proposed to confer this and other honorary degrees on June 2 when Founder's Day will be celebrated and the new library formally opened

Dr Stanley Hodgson has been appointed lecturer in forensic medicine and Dr E N Rowlands chief medical assistant in the Department of Clinical Investigations and Research

UNIVERSITY OF EDINBURGH

The University of Edinburgh proposes to confer the honorary degree of *LL D upon Dr Edwin Bramwell F R C P* Emeritus Professor of Clinical Medicine in the University and consulting physician to the Royal Infirmary Edinburgh

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A meeting of the Council of the College was held on March 11 with the President Sir Cuthbert Wallace in the chair

Mr R B Wade of Australia was admitted an Honorary Fellow of the College

Diplomas

A Diploma of Membership was granted to Donald Vale Hague

A Diploma of Fellowship was granted to Mervyn Henry Bowzer Robinson

Diplomas in Ophthalmic Medicine and Surgery were granted jointly with the Royal College of Physicians of London to the following candidates

A Ahmed F Bacon A K Banerjee F P C Claffy F J Darbyshire B K Das Gupta G S Dhillon M M A Dubash M A K Durrani R L C Fisher S A Foad V V Gupte Helen M Herbert R F Jamieson Eileen M Kennedy H M Kerr R Labhaya C R D Leeds B N Pershad J D Maude Kathleen A Pih S M Ruwala B Sheehan E C Srinivasan Jean W Strang K J Talbot B D Telang

The following hospitals were recognized for the six months surgical practice required of candidates for the Fellowship

Victoria Hospital Burnley House surgeon to Unit I house surgeon to Unit II

Withington Hospital West Didsbury Manchester Resident surgical officer senior and junior assistant medical officer

Prince of Wales's Hospital Plymouth Resident surgical officer house surgeon (1) house surgeon (2) and house-surgeon (3) at Greenbank Road senior house surgeon at Devonport until July 31 1938

King Edward VII Hospital Windsor First second and third house surgeons

INTER COLLEGIATE SCHOLARSHIPS BOARD

The London Inter Collegiate Scholarships Board announces that an examination for fourteen medical scholarships and exhibitions of an aggregate total value of £1 800 will commence on April 26 (altered date) They are tenable at University College and University College Hospital Medical School King's College and King's College Hospital Medical School the London (Royal Free Hospital) School of Medicine for Women the London Hospital Medical College and St George's Hospital Medical School Full particulars and entry form may be obtained from the secretary of the Board Mr S C Ranner M A the Medical School King's College Hospital Denmark Hill S E 5

The Services

DEATHS IN THE SERVICES

Major BENJAMIN ALLEN MATURIN R A M C (ret) died at Southampton on January 7 aged 76 He was born at Lymington on May 4 1860 was educated at St Thomas's and Bart's and took the L R C P and S Ed in 1884 Entering the Army as surgeon on August 1 1885 he became major after twelve years service and retired on August 1 1905

Colonel ARTHUR KENNEDY late R A M C (ret) died in Dublin on December 28 1936 aged 73 He was born at Ballygibbon County Tipperary on July 13 1863 was educated at the Carmichael School Dublin and took the *L R C S I in 1881 and the L R C P I in 1882 Entering the* Army as surgeon on January 30 1886 he attained the rank of colonel on September 29 1916 and retired on November 15 1919

Lieut Colonel JAMES ROCHEID FORREST R A M C (ret) died on January 22 aged 80 He was born at Brompton on September 2 1856 was educated at Bart's and took the L S A in 1882 and the M R C S in 1883 At Bart's he obtained an exhibition in natural science the Wix prize and the Hichen prize also a gold medal for botany from the Society of Apothecaries After holding the post of demonstrator in zoology at Bart's he entered the Army as surgeon on January 31 1885 passing in first was on half pay from November 18 1892 to February 17 1895 became lieutenant colonel after twenty years service and retired on June 2 1911 He took the D P H at Cambridge in 1907 and after retirement the M B B S Lond in 1927 and the M D in 1931 He served in the Sudan campaign of 1885 at Suakin receiving the Egyptian medal with a clasp and the Khedive's bronze star and in the Tirah campaign on the North West Frontier of India in 1897–8 gaining the Frontier medal with two clasps In 1914 he rejoined for service in the war of 1914–18

Honorary Brigade Surgeon DUKE PARKE R A M C (ret) died on January 17 aged 90 He was born on August 10 1846 was educated at the Ledwich School Dublin and took the L R C S I and the L R C P Ed in 1866 Entering the Army as assistant surgeon on March 31 1868 he became surgeon major after twelve years service and retired with an honorary step of rank as brigade surgeon on December 4 1886 He served in the expedition to Sherboro on the West Coast of Africa in 1887 when he was mentioned in dispatches

examination Discussing the comparative merits of operative and radiological treatment the author points out that there is no reliable evidence in support of the theory that radiological treatment queers the pitch for a subsequent operation Such operative mishaps as paralysis of the recurrent laryngeal nerve are avoided by radiological treatment, which assures a more accurately controlled reduction of thyroid hyperfunction than surgery does

Radiology

219 Carbohydrate Meal in Cholecystography

J L KESTEL (*Radiology* December, 1936 p 672) questions the value of the emptying rate of the gall bladder as determined by the fatty meal in the course of the routine tetraiodophenolphthalein cholecystography If the gall bladder is capable of producing a concentrated shadow its walls cannot be seriously diseased Usually the carbohydrate meal is also followed by some reduction in size of the original shadow With the smaller shadow of relatively increased density stones or other negative shadows might be discovered when overlooked in the original radiograph The carbohydrate meal has therefore an advantage over the fatty meal The author has adopted the following routine the patient receives at noon a meal devoid of fats, followed thirty minutes later by 2 5 grammes of dye The evening meal at 6 30 p m consisting largely of carbohydrates, is again followed by 2 5 grammes of dye Fruit juices are allowed during the first hour after either administration of the dye The first radiograph is taken the following morning at 8 30 and is followed by a carbohydrate meal consisting of two slices of toast with jam or jelly, a glass of orange juice and tea or coffee with sugar The second and last radiograph is taken two hours later In a few cases tried with glucose instead of the other carbohydrates the results were practically the same

220 Cranial Radiography and Hypertension

F ZUCHERINI (*Policlinico* Sez. Med January 1, 1937, p 18) in order to determine the relations between endocranial hypertension and the general arterial pressure made a radiological examination of the skull in 104 cases of hypertension, which he classified as follows (1) essential hypertension, twenty cases (2) essential hypertension with generalized arteriosclerosis, fifty four cases (3) hypertension due to renal disease, nine cases, (4) hypertension with failure of compensation twenty one cases In all the cases an examination was made of the arterial, venous and cerebro spinal pressure as well as of the fundus The results were as follows 85 3 per cent showed radiographic evidence of increased endocranial pressure consisting in an increased circulation in the lacunae of the diploe and a deformity of the sella turcica In almost all the patients the pressure of the cerebro spinal fluid exceeded the normal Zucherini maintains that the radiographic appearance of the skull found in hypertension constitutes a valuable new sign in cranial symptomatology and may approximately indicate the age of the arterial hypertension As regards the deformity of the sella turcica he emphasizes the importance of the infundibulo pituitary system as the central factor in the regulation of the circulation

221 Calcified Intracranial Tuberculoma

J P MARTIN (*Brit J Radiol* January, 1937, p 5) reviews the radiographic finding in a number of cases of intracranial tuberculoma Calcified intracranial tuberculomata are uncommon but not rare They are usually observed in patients who come under observation because of fits They are not usually associated with signs of increased intracranial pressure The patients commonly but not always, present evidence of tuberculous disease elsewhere in the body The age of the patients referred to in the paper varied between 12 and 57 years The tuberculomata were usually found in the cerebral hemispheres The majority were situated near the surface of the brain In a large proportion of cases two or more calcified lesions were present. They were of variable size, usually already densely calcified The shadows which they cast on the radiograph were often very irregular, with a tendency to a lobulated appearance When calcification was not uniform throughout it was most intense at the periphery or part of the periphery of the main mass The chief distinguishing radiographic features, as compared with calcified tumours, were the sharp delimitation and very rough and jagged surfaces

222 Lumbago and Sciatica

L STEHR (*Med Welt* December 19, 1936 p 1836) maintains that lumbago and backache are only seldom of neuralgic or myalgic origin In a large number of cases the radiographic examination reveals osseous and articular changes which are the actual cause of the pain The author then reviews all the possible relevant radiographic changes, and discusses their characteristic appearances and their differential diagnosis In his review he includes sacralization of the fifth lumbar vertebra, spondylitis deformans spina bifida, ossification of the ileo lumbar ligament metastases from tumours, and osteo arthritis of the hip joint

223 Spine of the First Metatarsal

According to R LEFOUX LEBARD (*J Radiol Électrol* December, 1936, p 667) a certain pathological and radiological importance attaches to the spine of the first metatarsal which in a pronounced form is rarer however than the spines of the olecranon and os calcis It may attain the length of 7 to 8 mm and pointing outwards grows from the external articular angle of the distal extremity (head) of the bone It is commonly bilateral but in three cases the author found the remainder of the skeleton normal radiologically save for (in one case) an analogous outward pointing spine at the proximal end of the second metacarpal Very rarely indeed the internal angle of the head of the first metatarsal is the site of origin of a similar spine That growing from the external angle may cause pain and difficulty in walking In one case it has had to be removed surgically

224 Cholesteatoma

A S MACMILLAN (*Amer J Roentgen* December, 1936 p 747) describes two types of cholesteatoma—the true and the false, or primary and secondary The true cholesteatoma is rare Cushing reported fifteen in his 2 023 cases of cerebral tumours They are inclusion tumours of ectodermic origin They cause local changes and do not produce metastases Their size and shape vary greatly The false or secondary variety may be found in the middle ear, attic, mastoid antrum external auditory canal or nasal sinuses They are important because they often produce intracranial complications Their presence in the mastoid antrum can be demonstrated in a slightly modified Towne view using an inclination of 40 degrees for the tube instead of the usual 30 degrees The average size of the antrum in a completely sclerosed mastoid is 6 mm in the transverse diameter and 10 mm in the vertical Any increase in size of the antrum is due to erosion of bone by the growing cholesteatoma The density of the cholesteatoma itself is negligible in comparison with the density of the surrounding sclerosed bone Very large emissary veins and broad deep impressions in the bone caused by the lateral sinus must not be confused with the cavitation caused by the cholesteatoma

Medico-Legal

ALCOHOL OR INSULIN?

Mock Trial held by the Fellowship of Medicine

The Road Traffic Act, 1930 s 15 makes it an offence for a person in charge of a motor vehicle to be under the influence of drink or drugs to such an extent as to be incapable of controlling it properly One of the most difficult questions of fact which arises out of this provision is how far the unfitness is due to alcohol and how far to some innocent factor The Fellowship of Medicine did a useful service to the profession when on March 11 it staged a mock trial at 1, Wimpole Street, in which a typical situation of this kind was clearly worked out

The Case Opened

A motorist (Mr W W Anderson) was undoubtedly unfit to have control of his car he had stalled his engine at a crossing when the lights went green, driven across it when they turned red again, zigzagged up the hill, and come to rest on his wrong side of the road, being found by a policeman with his head resting on his arms across the steering-wheel He was taken to the station and at once examined at 10 53 p m He had all the clinical signs of drunkenness vagueness about the incident and about where he had been going and how he had got to the station, face flushed, skin slightly moist sleepy appearance, furred tongue, slightly alcoholic breath, exaggerated knee jerks until he controlled them consciously unsteadiness on standing with the eyes shut and the feet in line, inaccuracy in trying to put a finger tip on the end of the nose, pulse full and rather fast The police surgeon, whose part was convincingly acted by Dr P B Spurgin, laid particular stress on the sluggish reaction of the pupils to light they were somewhat dilated and took an abnormally long time to contract to light and to dilate again when the stimulus was removed The defendant sent for his own doctor, Dr T R Snelling, who examined him at 11 15 p m and found his gait, mental processes speech, and reflexes normal, his face flushed and his pupillary reaction still slow and pronounced him fit to drive The defendant himself said he was a diabetic under treatment, taking regular doses of insulin He had drunk nothing that evening but three half pints of beer, the last being at 7 o clock Not liking the food at the public house he had been content with a few sandwiches only He had taken a dose of insulin about 7 and at 8 o clock suffering from a raging toothache, he had gone to the first dentist in sight and had a tooth out after the gum had been sprayed with ethyl chloride He had felt ' muzzy ' at the time

Expert Evidence

In addition to the clinical evidence the prosecution called Dr H K V Soltau, an expert in the Widmark test for blood alcohol Two samples had been taken at about 11 30 p m by Dr Snelling in the presence of Dr Spurgin, and in one of these Dr Soltau found a content of 150 mg of alcohol per 100 grammes of blood The relation of the Widmark reading to the clinical condition is not very controversial and was not seriously contested between the expert witnesses called on the two sides, who, however, contradicted each other in many other material respects with praiseworthy faithfulness to custom The figures Dr Soltau gave were practically no disturbance under 100 mg except in fine psychological tests clinical signs of intoxication in 65 per cent of patients with over 100 mg , unfitness to drive in most patients with over 120 mg People with abnormally high tolerance for alcohol he said do not usually show a high reading For the defence Sir James Purves Stewart said that anyone with a reading over 200 mg was hopelessly drunk, 80 per cent of people with over 180 mg were moderately drunk 66 per cent of persons with over 160 mg and 33 per cent of persons with over 100 mg showed clinical intoxication

Fallacies of the Widmark Test

The defendant's Widmark reading was 150 mg, but both experts agreed that the test was subject to certain fallacies The most important is the presence of acetone, which gives the same reaction as alcohol and which may easily be present in the blood of a diabetic up to 25 or 30 mg , and an anæsthetic may account for another 5 or 10 mg It was therefore necessary to knock off 25 or 30 mg from the defendant's 150 mg as doubtful Acetone is not eliminated from the blood in under about four hours, and if the defendant as he might have done, was carrying 30 mg at 7 o clock—the maximum dose short of acute signs of acetonæmia—this would not be much diminished by 11 30 p m He could not therefore be fixed with a higher blood alcohol than about 125 mg and the jury had still to reckon with the non alcoholic factors—hypoglycæmia hunger fatigue shock after the extraction the effects of the ethyl chloride, and emotional disturbance at being charged with a serious offence Dr Spurgin maintained that the sluggish reaction of the pupils to light was pathognomonic of alcoholism, but Dr Snelling said that insulin would be capable of causing this symptom The result was that the judge summed up strongly in favour of the defendant and the jury, after a short conference, found him not guilty

Commentary

The Fellowship, therefore, had prepared its script most successfully to load the evidence against the defendant up to a point which very nearly counterbalanced the doubt The case was indeed a borderline one, for the awkward fact remained that the Widmark test showed at least 120 mg of alcohol which could not be accounted for by any fallacy The defendant got off largely because of the characteristic distrust with which the judge and jury obviously viewed the scientific evidence, and because of the stress which the judge placed on an answer by Sir James Purves Stewart which indicated that in his opinion the 34 per cent of persons who did not show clinical signs of alcoholism with 160 mg in their blood must be hardened topers—an incredible percentage spread over the whole population The trial was therefore highly successful, for the facts were by no means improbable The judge was Mr W H Cartright Sharp, K C, and the jury was composed of twelve persons eminent in various walks of public life Counsel for the prosecution and defendant were respectively Mr W A L Raeburn, with him Mr H W Paton, and Mr Laurence Vine, with him Mr O H J Bertram the witnesses and officers of the court were played very creditably by members of the Fellowship

A CASE OF IMPOSTURE

At Manchester Assizes, before Mr Justice Porter Patrick Ryan, aged 38, a native of Manister Croom, Ireland, pleaded guilty on six counts to obtaining food and medicines from two hospitals on the pretence that he was a medical man A list of previous convictions dating back ten years, including a conviction for fraudulent conversion, for which he was sentenced to three years' penal servitude at the Central Criminal Court in 1934, was given by the police who described Ryan as an unscrupulous rogue and an impostor of the worst type He was sentenced to four years' penal servitude

It was stated for the prosecution that Ryan went to Warrington Infirmary and told the house surgeon that he was a medical man (a stethoscope in his pocket lent colour to his story) and had been injured in a car accident He was treated, and later transferred to Leigh Infirmary He told the authorities that his brother would be responsible for a bill of three guineas for treatment, but it was never paid At Liverpool Stanley Hospital he gave the name of Dr Francis Ryan of County Clare, told the same story and was supplied with morphia and food In a statement Ryan admitted to similar impostures at hospitals and nursing homes in Dublin where he represented himself as a doctor, and elsewhere in Ireland obtaining money from various persons, and asked that these offences might be taken into account It was stated, however that offences in the Irish Free State could not be dealt with at the present assize

Obstetrics and Gynaecology

225 Ovarian Tumours

BERNSTEIN (*Amer J Obstet Gynec*, December, 1936 p 1023) reports a tabulated study, difficult to summarize adequately of 1,101 surgical cases of ovarian tumour Classified by types, simple cysts 47 per cent, dermoids 16 per cent, and papillary serous cystadenocarcinoma 14 per cent, are by far the commonest Malignancy occurred in 17 3 per cent sarcoma in 1 per cent The third decade is the commonest age, 82 per cent of simple cysts and 83 per cent of dermoids being found between 20 and 50 years Of ten cases of embryonal neoplasms 80 per cent were in the age group 10 to 20 years 58 per cent of climacteric ovarian tumours were malignant and 11 5 per cent of premenstrual ovarian tumours Tumour frequency in the nonparous is about double that in parous women Normal menstruation is remarkably common (54 3 per cent) Secondary amenorrhoea occurred in 3 per cent oligomenorrhoea in 2 per cent Menopausal bleeding was noted in only 1 3 per cent, all but 0 4 per cent being in malignant cases Dysmenorrhoea was found in 15 per cent of all cases Metastases were already present at operation in 76 per cent Symptoms were insidious in onset, hence the advanced stage of the disease when treated Pain (seldom severe) was a complaint in 75 per cent of all patients, being slightly commoner in benign growths (dermoids 95 per cent) In 30 per cent it was other than pelvic Vomiting and nausea occur one and a half times more often in malignant cases than in benign, also, though less common, bladder symptoms 21 per cent of all tumours in the series were bilateral The incidence of ascites was 54 per cent in malignancy, 21 per cent had an abdominal mass The sedimentation test was useful in inflammatory, degenerative, and infective processes

226 Wassermann Test in Pregnancy

T D HUGHES and C GAMMIE (*Med J Austral*, December 5, 1936, p 783) in routine Wassermann tests on pregnant women coming for ante-natal treatment found positive results in seven (0 47 per cent) of 1,496 primiparae and in twenty-five (1 31 per cent) of 1 908 multiparae Of the Wassermann positive multiparae ten had no history suggestive of syphilis and would have been missed, along with other unsuspicious cases, had the test not been done as a routine Antisyphilitic treatment was instituted in the thirty two Wassermann-positive cases and of twenty-five of these who were followed up there were born twenty live and five dead children Several of the children born alive had a positive Wassermann reaction The authors emphasize the importance of the preventive aspect of the routine Wassermann reaction test in pregnancy

227 Forceps Delivery after Maternal Death

S TAPFER (*Zbl Gynak*, January 16, 1937, p 148) comments on the curious fact that the literature contains reports of several hundred cases of Caesarean section, in the foetal interest, in dead or dying mothers, but only five reports of vaginal delivery (forceps in four, version in one case) in similar circumstances *Sectio in mortua* mentioned in classical mythology was compulsory in ancient Rome and mediæval Venice, and appears to have been carried out for judicial reasons even if the child were dead or non viable During the past half-century Caesarean sections in dead subjects seem to have given living infants in 20 to 60 per cent of cases There is no chance of survival of the foetus when the mother has been dead more than twenty to twenty five minutes The operation should be done *lege artis* for at least three cases are on record in which supposedly dead mothers have come to life for a time after Caesarean section It would appear that a vaginal examination as a preliminary has been omitted in many of these cases at any rate the records contain no statement of the condition of the cervix Heinricius in 1883 was the first to report delivery by forceps of the living child from a dead mother she had died suddenly from rupture of the aorta Korbitz in 1869 was summoned to a dead mother, sent home for his forceps and delivered fifteen minutes after death a foetus which survived the case was not reported however, until 1900 In Tapfer's case, here published of forceps delivery *in mortua*, the cause of death was acute lung oedema with recurrent endocarditis about four minutes had elapsed since maternal respiration and heart beats had ceased, and the child survived

Pathology

228 Tuberculin Reaction in Monkeys

The frequency of tuberculosis in captive monkeys has led A URBAIN and J NOUVEL (*C r Soc Biol*, 1936, No 36 p 1123) to make observations on the reaction of these animals to tuberculosis Dermal, intradermal, and ophthalmic tests were made on a total of sixty-two monkeys of the genera *Pithecus, Cercocebus, Hamadryas* and *Erythrocebus* in the zoological gardens at Vincennes, which were found clinically and later by post-mortem examination to be tuberculous The reactions were uniformly negative On the other hand, the subcutaneous inoculation of 0 5 to 1 5 c.cm of tuberculin caused sometimes but not always, a fleeting rise of 2° to 2 5° C in the animal's temperature, developing usually in five to seven hours The subcutaneous reaction appeared to be more marked in chimpanzees, which showed a rise of temperature of 1 5° C in six hours, persisting for three to four hours, but only two of these animals were studied

229 Immunization in Scarlet Fever

J WICKSTROM (*Finska LakSallsk Handl*, December, 1936 p 1029) draws attention to the seriousness of the problem of scarlet fever in the Finnish Army, in which its incidence has grown rapidly since 1928 In this year there were 179 army cases with seven deaths In 1935 there were 768 cases with thirteen deaths Dick tests carried out on 3 367 soldiers showed that 2,865 (85 1 per cent) were Dick-negative In 2 8 per cent the reactions were ambiguous, and in the remaining 12 1 per cent the soldiers were Dick-positive The incidence of scarlet fever among the Dick-positive soldiers was as high as 20 4 per cent, whereas it was only 0 34 per cent among the Dick negative The author has conducted immunization tests with both toxin and anatoxin as antigens, and in a group of 131 soldiers there were seventy-four Dick positive men each of whom received a full course of three injections To ascertain the degree of immunity to scarlet fever conferred by this treatment the author selected as controls seventy-four men whose positive Dick reaction had been similar to that of the seventy-four artificially immunized and living under the same army conditions During the ten months the two groups were under observation twelve of the controls developed scarlet fever, whereas there was not a single case of it in the immunized group The difference between the members of the two groups was very marked in one company, in which thirteen men were found to be Dick-positive Six of them were artificially immunized the remaining seven serving as controls When an epidemic of scarlet fever overtook this company all the five men falling ill belonged to the control group With regard to the comparative merits of toxin and anatoxin as antigens the author finds that practically identical results were obtained with the two to judge by the proportion of conversions from Dick-positive to Dick-negative reactions Both antigens required about two months in which to develop their full action, but the large doses of toxin needed to achieve the desired results were sometimes provocative of a disturbing general reaction For this reason the author prefers anatoxin to toxin as an antigen

Medical Notes in Parliament

In the House of Lords on March 15 the Local Government (Financial Provisions) Bill was read a second time On the following day the Divorce (Scotland) Bill was read a third time

The National Health Insurance Act Amendment Bill which has passed the House of Lords was read a first time in the House of Commons on March 10 Mr Oliver Stanley introduced the Physical Training and Recreation Bill on March 16 The Bill, which is supported by Mr Elliot, was read a first time The House of Commons this week debated the Estimates for the Air Force and the Army Mr Chamberlain brought in a message from the King inviting consideration of the Civil List for the new reign A Select Committee of the House of Commons heard witnesses and counsel on the proposal to transfer Wadsley Mental Hospital from the West Riding County Council to the Sheffield City Corporation under the Sheffield Corporation Bill

Sir Kingsley Wood announced an agreement to submit to arbitration the whole scale of remuneration for medical men under the National Health Insurance Act The form of the tribunal and procedure will follow the precedent when this scale was last examined

Dr Howitt will be added to the Standing Committee on Scottish Bills for the examination of the Methylated Spirits (Scotland) Bill

Factories Bill in Committee

Clauses 6 and 7 of the Factories Bill were ordered to stand part of the Bill when a Standing Committee of the House of Commons resumed discussion of this measure on March 9 On Clause 8 (Enforcement by District Councils for certain provisions of Part I) Sir JOHN SIMON accepted amendments proposed by Colonel Sandeman Allen extending to inland navigations the saving provided for railways and docks On the motion that Clause 8 stand part of the Bill Mr GRAHAM WHITE said that divided control as between different types of factory was undesirable District councils might not have sufficient staff for inspecting workshops and factories Good and sound administration would be secured if the whole responsibility for inspection were undertaken by the inspectorate of the Home Office Mr RHYS DAVIES said Clause 8 referred to factories in which mechanical power was not used and in which the responsibility for ensuring that the places were clean lighted and ventilated would rest exclusively with the local authorities Different standards as to what was decency in a factory were laid down by local authorities

Sir JOHN SIMON said he hoped that when the Bill reached the Statute Book the Home Office would secure a substantial increase in the number of factory inspectors He had arranged this with the Treasury, and in due course would move the necessary financial resolution They wanted the additional inspectors for the most important factory services Inspectors were particularly skilled to look after the fencing of machinery and to see that important clauses of the factory code were observed but a great range of work might clearly be charged to responsible local authorities If local authorities did not do their duty Clause 9 provided for taking the work out of their hands The provision in Subsection 2 in Clause 8 which entrusted to the district council the supervision of a factory where mechanical power was not used would apply only to premises which used to be called workshops The existing law entrusted these workshops to the district council Later in the Bill Clause 145 (3) would provide that premises were not to be taken out of this class by reason only that mechanical power was used for heating ventilating or lighting the workrooms or other parts of the factory

The clause as amended was then added to the Bill

LOCAL AUTHORITIES POWERS

On Clause 9 (Powers of Inspector as to Sanitary Defects Remediable by District Council) Mr ALFRED SHORT moved to substitute alternative words authorizing the inspector where he was satisfied that no proceedings had been taken by a district council for punishing or remedying an act or default to take the action which the district council might have taken for punishing or remedying such act or default Mr Short said local authorities had not displayed a great deal of activity in enforcing public health provisions in regard to factories Mr R S HUDSON said that to justify this amendment it was not sufficient to assert that medical officers of health factory inspectors and local authorities generally were not carrying out their duties efficiently Mr Short had merely made a general accusation of inefficiency against medical officers of health and local authorities

On a division Mr Short's amendment was rejected by 28 to 16 An amendment moved by Mr BUCHANAN to authorize an inspector to take proceedings if the district council had not done so within five days of the notice of default instead of within one month as proposed by the Bill was withdrawn A further amendment by Mr SILKIN was negatived and Clause 9 was added to the Bill

MEDICAL SUPERVISION AND MEDICAL TREATMENT

Clause 10 was also ordered to stand part of the Bill On Clause 11 (Power to Require Medical Supervision) Mr ELLIS SMITH moved to leave out the provision that the arrangements to be made for medical supervision of persons employed in a factory where special reasons for such arrangements had been found by the Secretary of State to exist should not include medical treatment Sir JOHN SIMON said he was prepared to alter this restriction so that it should run Not including medical treatment other than first aid and medical treatment of a preventive character Mr Ellis Smith said that proposal hardly dealt with what he had in mind The Bill did not conform to modern standards in regard to silicosis lead poisoning dermatitis and several other industrial diseases The chief inspector's report for 1935 said that cases of tuberculosis of the lung occurring in specific places of employment had been disclosed in increasing numbers The same report stated that lead poisoning was having greater effect on the health of people employed in industry and that there had been no reduction in the number of deaths from silicosis and asbestosis In Sheffield and in parts of Manchester and North Staffordshire people pointed out the effect of these diseases on women's faces The Bill would be lacking unless it procured that these people received medical attention At present their treatment was their own individual responsibility whereas it ought to be the responsibility of the Home Secretary and of the employers

Sir JOHN SIMON said the clause did something entirely new and was a great advance Nothing in the present factory code required special investigation or medical supervision where an inspector found in a class of factory that owing to the nature of the process or for other reasons disease or other unfitness was developing The clause would put on the occupier the duty of procuring that a properly skilled man watched what was going on examined people who seemed to be developing illness and found out what was the matter The employers were willing to accept that burden under special regulations Mr Ellis Smith wished to provide in addition that there should be medical treatment at the expense of the occupier but the national health insurance scheme was already in existence and in many cases trade unions had elaborate arrangements for providing medical treatment Mr Smith's desire to ensure treatment of a preventive character would be met if the committee kept in the words Not including

HOWARDS' STANDARD ETHER

Surpasses the B.P. tests

In ¼-lb, ½-lb and 1-lb Amber Bottles and in Winchesters

medical treatment, but added 'other than first-aid treatment and medical treatment of a preventive character'

Mr Ellis Smith then withdrew his amendment and the words proposed by Sir John Simon were added to the clause

On a subsequent amendment Mr BURKE asked whether regulations under the clause could prohibit the employment of young persons on certain processes He had in mind a factory in which a good deal of naphtha was used and the fumes constantly made boys unconscious for periods, although the effect on older persons was not the same Sir JOHN SIMON said that restrictions and prohibitions would not be made under this clause but under Clause 58, where special regulations in respect of dangerous trades might be applied particularly to young persons The amendment under discussion was withdrawn, and, in reply to Mr Buchanan, Sir John Simon said that the power to require medical supervision under Clause 11 could be applied to a section only of a factory Mr Buchanan asserted that in his part of Scotland the men working in one part of a factory some years ago were affected for short periods by a form of lunacy, and had to be taken into mental homes for care No further particulars were given in respect of this assertion, and Clause 11 was added to the Bill

The committee then adjourned

FENCING OF MACHINERY

When discussion was resumed on March 11 Clause 12 (Prime Movers) came under full consideration The chairman suggested that there should be a general discussion on the fencing of all types of machinery, and this arose accordingly on a motion proposed by Mr ELLIS SMITH Sir JOHN SIMON said the term 'prime mover' was not contained in the existing Factory Acts Enormous developments in the use of electrical machinery had taken place since the statute of 1901 Belts and pulleys had been largely replaced by electrical machinery, and it was a great thing to get rid of the old fashioned pulleys, which had been responsible for many bad accidents The question to be asked was whether a particular apparatus was in such a position or of such construction as to be as safe to every person employed on the premises as it it were securely fenced If the answer was 'Yes' nothing would be gained by fencing it His officials had assured him that they believed the form of the clause was practicable The best modern practice was that the whole machinery should be shut off Additional safety provisions were made in subsequent clauses Clause 13 (3) provided that no driving belt when not in use should be allowed to rest or ride upon a revolving shaft which formed part of the transmission machinery To make that provision mandatory was an important contribution to safety Clause 15, dealing with the lubrication of things in motion, was also important from the Home Office point of view, and would show that although there were cases where moving parts had to be lubricated such work was now regarded as safe The Home Office would study carefully what was said by the committee and the inspectors were not disposed to encourage laxity in the matter

The amendment moved by Mr Ellis Smith challenging the clause was defeated by 26 to 15 and the clause was ordered to stand part of the Bill

On Clause 13 (Transmission Machinery) Sir WALTER SMILES moved to insert that 'only male persons over 18 years of age should be allowed to put a belt upon a revolving shaft pulley which ran at a speed of more than fifty revolutions per minute He said the greatest number of accidents resulted from these moving belts Mr GEOFFREY LLOYD said the Government sympathized with the amendment, but did not think it right to have one which was quite so sweeping There was no danger in women and young persons mounting moving very light belts He invited Sir Walter Smiles to consult with the Home Office advisers to see whether a new clause could be inserted restricting the mounting of belts by young persons

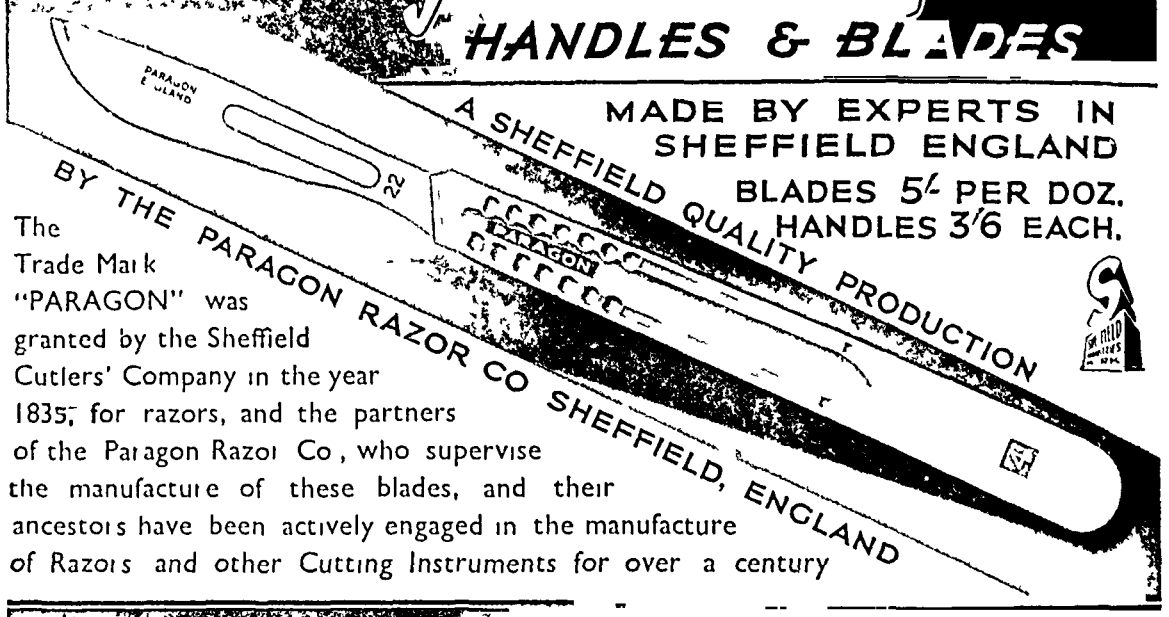
Sir WALTER SMILES withdrew his amendment and the clause was added to the Bill

On Clause 14 (Other Machinery) Mr ELLIS SMITH moved to provide that no person under the age of 18 should be employed in operating a circular saw or overhand planer He said it was still impossible to guard such machinery as other machines were guarded In practice most men did not allow boys to go on the machines until they were 18 years of age Mr LLOYD said these were not the only machines which involved special risk The question was whether it was wise to mention in the Bill particular machines and not to mention others, as for example, vertical spindle moulders which were also dangerous. The better principle was to give general power to deal with these matters by regulation because new and dangerous machines often came into use The Home Office would consider whether it could stiffen up the regulation which did deal partly with young persons and would also consider the question of all circular saws

Mr ELLIS SMITH withdrew his amendment

Colonel SANDEMAN ALLEN moved to leave out Subsection 3 of Clause 14 which provided that Any part of any material or article which is dangerous while in motion in any machine shall be securely fenced unless it is in such a position as to be as safe to every person employed or working on the premises as it would be if securely fenced provided that the requirements of this subsection shall not apply to a case where it is not practicable to comply therewith without serious interference with the work" Mr LLOYD said this also was an important new power which had not existed before It was brought forward because of cases of serious accident where workmen had been injured not by a machine but by a moving piece of material in the machine, particularly in lathes The Home Office was clear on what it wanted but would go into the matter before the report stage and see whether it could define its purpose more exactly

Colonel ALLEN then withdrew his amendments Two other amendments were withdrawn and the committee adjourned until March 16



Disposal of Trade Effluent

Lord GAGE moved in the House of Lords on March 10 the second reading of the Public Health (Drainage of Trade Premises) Bill He said it was similar to a Bill introduced last year by Lord Gainford, which passed all stages in that House but failed to be considered in the House of Commons The main purpose of the present Bill was to render rivers and streams more free from pollution than at present by extending facilities to traders and owners of factories enabling them to discharge trade effluents into sewers rather than into rivers Authorities possessed these powers but had been unwilling to exercise them because of the expense which by so doing they imposed on these traders Moreover it was uneconomic to expect each factory to put down separate works for purification of effluents To solve that problem much investigation and consultation had been needed The Government proposed to require the local authorities either to come to agreement with the traders in regard to particular applications or to make by-laws setting forth the terms on which the effluents might be discharged into sewers These by-laws must be approved by the Ministry of Health, and a right of appeal from the traders to the Minister was provided The Bill was drafted as an amendment and extension of last year's Public Health Act The Bill only dealt with regulation of what might be passed through drains, leaving the drains to be regulated by the Public Health Act The waiting period before acceptable trade effluents might be discharged after notice was two months The local authority might consent to accept trade effluents unconditionally or subject to conditions, with an appeal provided to the Minister against refusal of consent or against the conditions imposed By-law making powers had been extended to enable the local authority to determine the maximum quantity of trade effluent which might be discharged from any trade premises on any one day without its consent It was proposed to leave London out of this Bill Later the London County Council might see fit to introduce legislation on similar lines

Lord GAINFORD thanked the Government for reintroducing the measure, and said it had the support of the Society of

"Paragon" Scalpel

HANDLES & BLADES

MADE BY EXPERTS IN SHEFFIELD ENGLAND

A SHEFFIELD QUALITY PRODUCTION

BLADES 5/- PER DOZ.
HANDLES 3/6 EACH.

The Trade Mark "PARAGON" was granted by the Sheffield Cutlers' Company in the year 1835, for razors, and the partners of the Paragon Razor Co, who supervise the manufacture of these blades, and their ancestors have been actively engaged in the manufacture of Razors and other Cutting Instruments for over a century

Obtainable from all the leading Surgical Supply Houses.

A Guaranteed Service for Deaf Patients

1 An audiometer test to determine the amount of hearing loss
2 Adaptation of a suitable aid to conform to individual requirements by differential amplification
3 A trial of the selected aid at home, without obligation to purchase
4 Submission of a full report to the doctor concerned, enabling him to supervise the trial
5 A guarantee covering any alterations made necessary by changing aural conditions
6 Every known type of hearing aid available, Valve amplifiers, Air conduction, Bone conduction, Nerve deafness aids and full non electric range

Members of the Medical Profession are invited to make full use of the service offered, with every confidence that genuine assistance will be rendered in the selection of a suitable hearing aid

Medical Officers of Health and of other bodies Lord STRABOLGI said the Opposition would give the Bill every help

The Bill was read a second time and sent to committee of the whole House

Estimates for 1937 Medical Provisions

The Navy Estimates for 1937 include a gross estimate of £482 160 for medical establishments and services reduced by appropriations in aid to a net vote of £411 400 compared with £467 330 gross and £397 300 net in 1936 Provision is made for the pay of 103 officers of the Royal Navy and for one of the Royal Marines on the medical establishments Allusion is made to receipts for treatment of Army and Air Force patients in certain naval hospitals and to payments for treatment of naval personnel at certain hospitals of the Army and Air Force in pursuance of a policy of co ordination to promote the most economical use of the hospitals of the Services Provision is made for the payment of the fees of medical and dental officers going through post graduate courses at civil hospitals

The estimated expenditure on medical services in the Army Estimates for 1937 is £1 055 000 against £1 071 000 for 1936 The establishment of the Royal Army Medical Corps is fixed at 474 officers in 19.7 against 471 in 1936 An increase of £25 000 to £107 000 is proposed in the vote for the pay of civilian medical practitioners and of £27 900 to £92 000 in the vote for medicines instruments and miscellaneous charges Provision for the Royal Army Medical College is unchanged at £33 300 It is stated that owing to the shortage of officers holding regular commissions some officers holding temporary commissions are employed at contract rates of pay Sixty re employed retired officers and civilian medical practitioners are employed where the number of troops does not justify the employment of officers on the active list of the R A M C Two medical officers are carried on the Chemical Defence Research Department The Estimates are accompanied by a memorandum from the Secretary of State for War which reports that in 1936 the health of the Army at home and abroad continued very satisfactory and no undue sickness was attributable to special service in the Eastern Mediterranean Mr Duff Cooper adds The increase in the number of candidates for commissions in the Royal Army Medical Corps continues to be well maintained an excellent type of young officer is now coming forward and it may be hoped that the establishment of regular officers will be filled at no distant date

A Supplementary Estimate for the Army in the year ended March 31 1937 issued on February 26 included an additional £22 000 for the Army Medical Services

In the Air Estimates for 1937 the provision for medical services is £439 000 compared with £382 000 in 1936 An increase of £26 500 to £186 000 is proposed in the pay of personal allowances of officers Fees to civilian practitioners remain unchanged at £21 000 Medical stores and supplies increase by £10 000 to £35 000 and payments to hospitals by £10 500 to £49 000 The establishment of officers in the medical and dental branches is fixed at 285 against 242 in 1936 A provisional estimate is made of £100 000 for a new Air Force hospital in East Anglia of which sum £9 000 will be voted in 1937 At Halton additions to hospital are to cost £80 000 of which £15 000 will be voted in 1937

The Civil Estimates 1937 for the Home Department Law and Justice include £73 059 for Broadmoor Criminal Lunatic Asylum against £71 161 in 1936

The Civil Estimates 1937 for Education and Broadcasting include £55 000 grant in aid to the British Post Graduate Medical School a decrease of £16 000 from the 1936 grant For building extensions to the school and meeting such part of the cost of certain extensions to Hammersmith Hospital as is attributable to the presence of the school £10 000 is devoted and for expenses of organization and maintenance of the school during the initial period £45 000 making £55 000 in all Any balance of the sum issued to the governors of the school which may remain unexpended on March 31 1938 will not be liable to surrender to the Exchequer but will be considered in connexion with subsequent grants

Road Accidents

In a debate on the Estimates for the Civil and Revenue Departments on March 10 Mr D N PRITT opened a debate on traffic control and road accidents Mr HORE BELISHA said that an examination of passenger and goods vehicles over twelve months disclosed that 18 000 of these classes of vehicles had such defects as to render them mechanically unsafe Out of 560 specially observed brake tests in 240 cases braking efficiency was under 30 per cent in 180 cases braking efficiency was under 25 per cent and in 130 cases braking efficiency was under 20 per cent What must be the condition of the brakes of the nearly 2 000 000 private vehicles not subject to such tests? The House could derive some encouragement from the reflection that whereas from 1931 to 1934 there was a continuous rise in accidents in relation to the number of vehicles that tendency had happily reversed Figures of the total killed and injured per 1 000 vehicles licensed were in 1931 94 per 1 000 in 1932 the figure was 95 in 1933 it was 97 in 1934 it was 99 in 1935 the total killed and injured per 1 000 vehicles licensed had fallen to 88 and in 1936 to 85

Commander FLETCHER said that in January 1936 there was an accident every two minutes One hundred children were killed every month and 4 464 people were killed or injured weekly Mr H G STRAUSS said nearly 70 per cent of fatal accidents occurred on straight roads or open roads with a good sight line More than 85 per cent occurred in clear weather and two thirds in daylight One of the main factors was abuse of the motor horn The Highway Code did not from beginning to end contain a single recommendation to sound the horn in any circumstances whatever But the Minister might go further in two respects in regulating the use of the horn and in prescribing the nature of the instrument

Replying to the debate Captain HUDSON said a committee which had been dealing particularly with the noise created by motor cars and motor cycles had now turned its attention among other things to the stridency of motor horns The analysis of road accidents had shown that 90 per cent were due to the human element Some 50 per cent happened on straight roads Some 33 per cent of accidents were caused by motorists 28 per cent by pedestrians and 26 per cent by cyclists Last month 321 persons were killed on unrestricted and 140 on restricted roads It would be unwise to rely on the speed limit alone for preventing road accidents The death roll had fallen from a peak of 7 300 in 1930 to about 6 500 in 1936 in spite of an increase of some 480 000 motor vehicles

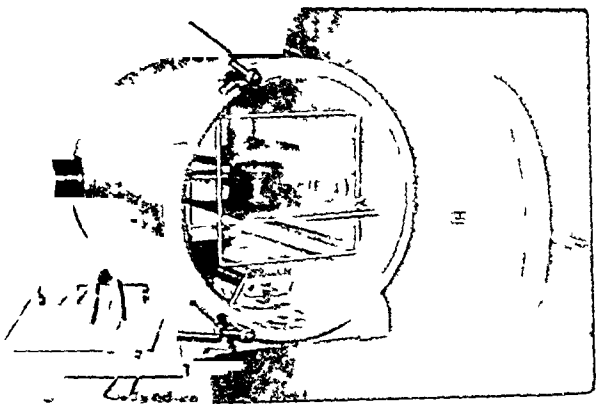
A motion moved by Mr PRITT to reduce the Estimates was defeated by 185 to 104

Capitation Fee in Respect of Young Persons

Mr RHYS DAVIES on March 15 asked the Minister of Health when he intended to introduce a Bill to bring into health insurance young persons on entry into employment whether he had now come to an agreement with the medical profession as to the panel fees in respect of such persons and if so what was the amount agreed Mr R S HUDSON replied that Sir Kingsley Wood could not say at present when this Bill would be introduced The question of the doctors fees for the young persons referred to had become bound up with the larger question whether the fees now paid for all insured persons called for revision by way of increase or decrease and the Minister had agreed with the suggestion of the medical profession that the whole matter should be referred to an independent court of inquiry

Health Insurance Practitioners

Sir KINGSLEY WOOD replying to Mr LYONS on March 15 said that the numbers of medical practitioners under agreement with Insurance Committees in England and Wales in 1935 and 1936 were 16 552 and 16 700 respectively and the total amounts paid to them from national health insurance funds in respect of those years were £7 345 338 and £7 728 000 The last named figure was approximate as the returns of expenditure were not yet complete



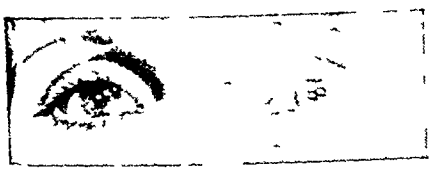
MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILISER

Patent No 427581

- EFFICIENT AND RAPID STERILIZATION
- SAVES TIME, SPACE AND MONEY

Maw Sterotherm Automatic Sterilizers have been installed in many Hospitals, Surgeries etc, throughout the country and are functioning with the utmost efficiency
The special features of the Sterotherm ensure complete sterilization of Instruments, Dressings etc., by the Hot Air method It is the ideal unit where economy of space and outlay are essential



May we send you details or arrange a demonstration?

SPECIAL FEATURES

- Automatic regulation of temperature
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ inches, diameter 9½ inches

PRICE £20

NAME

ADDRESS

Mental Out patient Clinics in Scotland—On March 9 Mr LEONARD asked the Secretary of State for Scotland the number of out patient clinics functioning under the Board of Control for the use of persons conscious of incipient mental trouble Mr ELLIOT replied that there were nine mental out patient clinics in Scotland—four in Glasgow, three in Edinburgh, one in Paisley, and one in Perth Seven were attached to general hospitals, and all were under the direction of psychiatrists from mental hospitals

Benefit Rates of Approved Societies—Mr JAMES GRIFFITHS asked on March 11 the average cash value of the additional benefits provided by approved societies under the National Health Insurance Acts Sir KINGSLEY WOOD in reply, assumed that Mr Griffiths referred to increases in the statutory rates of sickness, disablement, and maternity benefits and said the average increase, covering some 70 per cent of the insured population, was about three units, which was 3s a week in respect of sickness benefit, 1s 6d in respect of disablement benefit and 6s in respect of maternity benefit Some approved societies had made no increase Some of the most prosperous had made an increase of five units and also devoted funds to various treatment benefits

Trend of Population—Sir KINGSLEY WOOD told Mr Cartland on March 11 that the Registrar General was continuing and extending his investigations and researches into the trend of population Consultation was also proceeding to secure the co operation of the committee recently formed under the chairmanship of Professor Carr-Saunders At the present stage this was the most useful course to adopt

Medical Instruction in Air Raid Precautions—Mr GEOFFREY LLOYD told Mrs Tate on March 11 that sixteen medical instructors had been appointed who gave instruction in anti-gas precautions to medical practitioners, nurses, and medical students Up to the end of last month 3,059 doctors, 2,459 nurses and 569 medical students had been trained Arrangements were made through the British Medical Association, the College of Nursing, and the medical schools respectively Mrs TATE suggested that the Home Office should send instructors and apparatus to hospitals, in order that hospital staffs might become proficient in the use of gas masks and the necessary steps to take in the event of war Mr LLOYD said the instruction was often given at a hospital If a doctor at a hospital had made himself proficient in the use of masks permission would in any event be given for him to instruct his staff The doctors he had mentioned as medical instructors were stationed at key points throughout the country

Milk for Infants and Expectant and Nursing Mothers—On March 15 Mr ADAMS asked the Minister of Health whether it was intended to make the scheme for the provision of cheap milk for expectant and nursing mothers and children under school age general throughout the country, and whether its application for the six summer months only would be extended to the whole year in future Mr HUDSON said that it was the intention of the Milk Marketing Board and the Commissioner for the Special Areas that the schemes which had been in operation in Rhondda since July 17, 1936, and in Jarrow since January 1, 1937 should run until September 30, 1937 Before that date the Board and the Commissioner would consider the results with a view to a decision on the future of the schemes

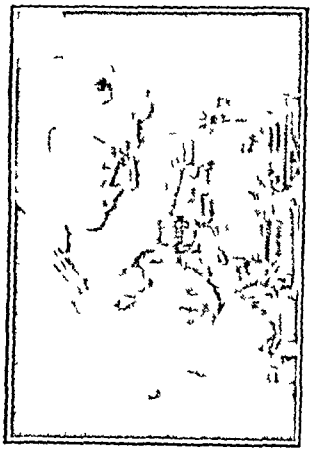
Milk Adulteration—On March 15 Mr DAVID ADAMS asked the Minister of Health whether he was aware that cases in recent prosecutions by the Newcastle Corporation under the Food and Drugs (Adulteration) Act 1928 of vendors selling new milk deficient in non fatty solids 17·2 per cent and 15·4 per cent respectively were dismissed by the magistrates and whether, as deficiencies on this scale indicated the presence of added water, he would consider legislation for the more adequate protection of the public in this matter Mr HUDSON replied that the Minister was not previously aware of these cases, but he had now received a communication from the town clerk of Newcastle with regard to them The Minister was making further inquiries

Deaths Following Vaccination—Sir KINGSLEY WOOD informed Mr Groves on March 15 that four death certificates were registered during 1936 on which the words vaccinia or vaccination appeared The ages of the persons to whom the certificates applied were 4 weeks, 4 months, 10 years, and 26 years respectively

On the same day Mr GROVES asked the Minister of Health how many deaths following or caused by vaccination had been reported since January 1, 1937, and Sir KINGSLEY WOOD replied that he had information of three such deaths Inquests were held in each case, and the verdicts were "broncho pneumonia, post-vaccinial encephalitis," "generalized vaccinia," and cerebral thrombosis following vaccination" respectively

Free Meals to School Children in Scotland—Mr ELLIOT told Mr Tom Johnson on March 16 that discretionary power to authorize the provision of school meals to necessitous children pending further investigation was allowed to head teachers of schools in Ayr, Dumfries, Fife, Wigtown, and Zetland Provision of school meals pending investigation was authorized by the authority on the receipt of a report from the head teacher in Aberdeen, Edinburgh, Glasgow, East Lothian, and Sutherland No instructions to insist upon production of a medical certificate proving under nutrition before food was supplied had been issued by the Scottish Education Department

Expenditure on Mental Deficiency—Mr CECIL WILSON asked on March 16 if the expenditure in respect of mental deficiency which had fallen upon the rates of county and county borough councils had risen from £694,390 in 1929–30 to £2,031,949 in 1932–3, and what caused such an increase Mr ROBERT HUDSON said the figures Mr Wilson quoted did not represent the real position The expenditure by local authorities amounted in 1929–30 to £1,500,244 and in 1932–3 to £2,191,847 An Exchequer contribution to the cost was paid in both years, in the former as a direct grant of 50 per cent of expenditure, and in the latter as part of the block grant The increase in total cost was due to the fact that this was a growing service, and more attention was now being paid by local authorities to the matter



Immunization and Diphtheria Incidence in Huddersfield—Mr GROVES asked how many cases of diphtheria had been recorded in Huddersfield in children who had been immunized against that disease and whether there had been any deaths in immunized children during the period in which immunization had been practised Sir KINGSLEY WOOD said he had been in communication with the local authority, which had furnished the following information Approximately 50 per cent of the children of Huddersfield had been immunized to protect them against diphtheria During the past four years among the 50 per cent not treated by immunization there were 1,138 cases of diphtheria resulting in 133 deaths During the same period, among the 50 per cent treated by immunization, there were forty cases of diphtheria resulting in one death The one death was the only instance of fatal termination in a child who had been immunized

Notes in Brief

Sir JOHN SIMON states that there has never been occasion to impose the maximum penalty under the statute regulating vivisection

The average cost of living of working class families was approximately 42 per cent above the pre war level at February 1, 1935, and 47 per cent above the pre war level at February 1, 1936

Experience of the Factory Department of the Home Office has not proved that the effect of glass silk upon persons employed in handling it is so serious as was feared in 1931 Special inquiries are being made, however, to determine what further action is called for

BRITISH ASSOCIATION OF RADIOLOGISTS
(FELLOWSHIP BOARD)

Fellowship Examination

The first examination for the Fellowship of the Association will be held in London during the period November 29th to December 3rd

The examination is limited to Medical Practitioners who are duly registered in the country in which they practise and who hold a recognised Diploma in Radiology The Diplomas so far recognised are those granted by the following bodies The Universities of Cambridge Edinburgh Liverpool and London the Conjoint Board of the Royal College of Physicians of London and the Royal College of Surgeons of England and the American Board of Radiology

The principal subjects of the examination are

I RADIODIAGNOSIS
II RADIOTHERAPEUTICS

All candidates must present themselves for examination in both subjects and will be required to pass in one of them on an honours standard They will also be examined in general medicine general surgery and general pathology but those who have qualified by examination for higher medical or surgical degree or diplomas may be exempted partly or wholly from this part of the Fellowship examination A thesis concerned with some aspect of their honours subject is also required from candidates and must be presented before the end of August

In addition to passing the examination candidates must comply with the conditions for ordinary membership before they can be elected Fellow

Further particulars may be obtained from—

INDIAN MEDICAL SERVICE

Recruitment of European Officers

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or of £2,500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

British subjects of pure European descent who are under 32 years of age and who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply.

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience including clinical preventive specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant-Colonel and by selection to the ranks of Colonel and Major-General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools.

RATES OF PAY

Years of Service	Rank	Basic Pay £ per mensem	Overseas Pay £ per month	Total £ per annum
1	Lieutenant	400	£1	£ s
	Captain	400	£	£ 0

24		1400	£10	£1830
25	-	1400	£10	£1830

NOTE.—(1) The rupee is at present stabilised at a rate equivalent to 1s. 6d.

(2) An officer promoted to the rank of Lieut.-Colonel before completion of 20 years' service will receive pay at the rate of Rs.1,200 per mensem (basic) + £40 per month overseas pay.

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Candidates possessing certain higher medical qualifications or holding the Diploma in Public Health may be granted an antedate in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate. Persons holding or about to hold resident posts at recognised hospitals may be seconded in those posts for a period. The maximum period of antedate secondment or antedate and secondment combined admissible under this paragraph is limited to eighteen months.

OUTFIT ALLOWANCE

Officers on appointment will receive an allowance of £75 towards the cost of outfit.

PRIVATE PRACTICE

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided. Extra leave (known as study leave) which may not exceed 12 months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a post-graduate nature. During such leave study allowance at present fixed at the rate of 12s. a day in the United Kingdom £1 a day on the Continent of Europe and £1 10s. a day in the United States of America and Canada is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pensions are as follows:

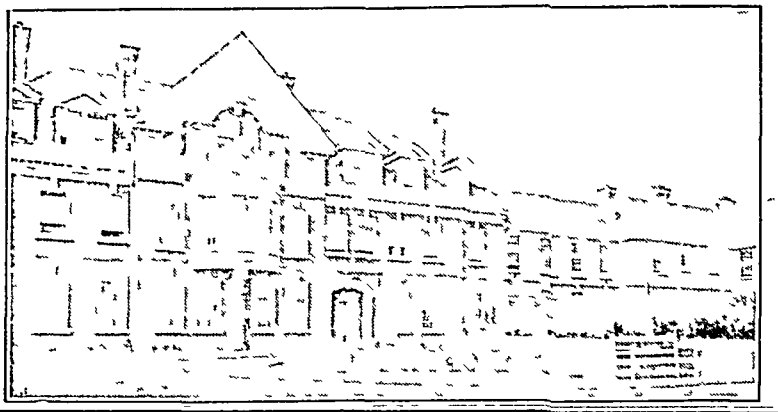
	per annum £	s	d
After 17 years' service for pension	372	0	0
18	400	0	0
19	428	0	0
20	465	0	0
21	502	0	0
22	539	10	0
23	576	10	0
24	614	0	0
25	651	0	0
26	697	10	0
27	744	0	0

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.



INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately three months prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the Under Secretary of State for India, Military Department, India Office, London, S.W.1. The Selection Committee will meet at the India Office early in April next and the selected candidates will be required to join a course of instruction commencing on May 1st prior to sailing for India about September 1937. Applications should be submitted as soon as possible.

Health Department, Guildhall Hull
March 1937

Operated in the interests of the public

The CLINIC

By one of the provisions of its constitution the Company operating The Clinic is bound to devote the whole of the surplus revenue to the furtherance of its objects

Actually, under this provision, a sum of over seven thousand pounds was expended during 1936 on a thorough reorganisation of the nursing and catering services and on extensive renewals of, and additions to, equipment and furniture

In spite of this, the charges remain at an average of 14 guineas per week per room, with a few rooms at 10 guineas and others ranging up to 18 A new feature, introduced over the past year is the provision of a special free dispensary service included in the rates of all rooms

A total of nearly four thousand patients was received at The Clinic during 1936

You are invited to inspect the accommodation and facilities of The Clinic at your convenience—they are at the disposal of all Practitioners on the Register of the General Medical Council The Secretary will gladly send further details

'VARIBAN' ELASTIC PLASTER BANDAGE

VARIBAN BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg It is made from a specially woven selvedge material possessing highly elastic properties and is impregnated with an antiseptic zinc oxide paste

VARIBAN is self adhesive and combines the principles of firm equable pressure and support to the swollen leg with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair

In promoting proper circulation VARIBAN steadily reduces oedema It provides protection to the granulations of the healing ulcer In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application The necessity for ointments lotions etc is obviated while VARIBAN provides an ambulatory treatment which allows of full activity of the limbs with better results than those following rest in bed alone

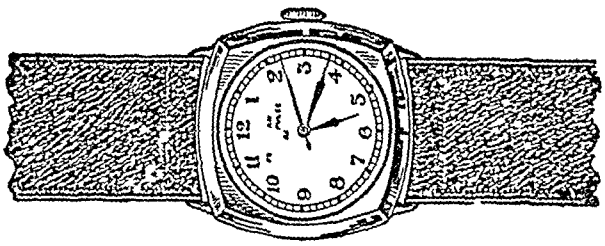
Made completely in England by Lodge Plugs Ltd, Rugby



De KUYPER'S HOLLANDS

Distilled with the Juniper berry from genuine malt liquor The advantage gained by distilling the berry with the spirit is the production of a preparation of Oleum Juniperi, mellow and free from all irritating properties.

It can be described as carminative, anti-spasmodic and a stimulating diuretic, valuable in many conditions and can be safely taken with regularity

Distilled by the same family for 241 years

OUR 50 YEARS' REPUTATION

F BRICCS Secretary Supt

AGAROL

FOR CONSTIPATION

During Pregnancy

Interference with free elimination from the bowels always presents a special menace to the well-being of the patient

In these circumstances AGAROL is an ideal evacuant that promotes intestinal elimination

Agarol is the original mineral oil and agar-agar emulsion with phenolphthalein It mixes thoroughly with the bowel contents The oil softens and lubricates the fæcal mass, the agar-agar retains moisture and the phenolphthalein *gently* furnishes the impulse that stimulates the peristaltic wave

Agarol is palatable and easily taken It exerts no effect upon the uterus, nor does it interfere with lactation Agarol can, therefore, be safely used at any stage of pregnancy

A supply for clinical trial will be gladly sent on request to Members of the Medical Profession

DISEASES OF THE HEART

THEIR DIAGNOSIS, PROGNOSIS, AND TREATMENT BY MODERN METHODS

With chapters on the Ink Polygraph, Clinical Electro-Cardiography, and Anaesthesia in Relation to Cardio-Vascular Affections

By FREDERICK W PRICE, M D, F R S (Edin)

Senior Physician to the National Hospital for Diseases of the Heart Consulting Physician to the Royal Northern Hospital London
Demy 8vo Pp 554 With 249 text figures including 32 sphygmogram 92 Polygraphic tracings and 67 electrocardiograms

NEW SECOND EDITION, 21s net

By great care and by the use of an amazing amount of material he has accomplished what many readers have been waiting for, giving us a complete account of the diagnosis prognosis and treatment of heart disease by modern methods in association with all the invaluable teaching to which we are accustomed from the older masters of clinical observations —LANCET

The most valuable and comprehensive guide to the study of Cardiology with which we are acquainted —NEW YORK MEDICAL JOURNAL AND RECORD

We think that most of our readers engaged in general practice will find this work extremely useful —THE JOURNAL OF CLINICAL RESEARCH

In our opinion the book is indubitably the most authoritative contribution to cardiology of our time —PACIFIC MEDICAL AND SURGICAL REVIEW

A book which we believe is destined to remain the standard work on Cardiology for many years to come —AMERICAN MEDICINE

The second edition of this popular work on heart disease bears evidence of thorough revision while the essentially clinical standpoint of the writer is maintained —EDINBURGH MEDICAL JOURNAL

It may be said at once that the book adequately fulfils the purpose it has in view and is a perfectly sound lucid and reliable guide —NEWCASTLE MEDICAL JOURNAL

Well written concise and complete containing a wealth of practical information Obviously based upon the author own experience and investigative work —SURGERY GYNECOLOGY AND OBSTETRICS (Official Journal of the American College of Surgeons)

Dr Price is to be congratulated again on the reappearance in a second edition of his distinguished contribution to the more limited important subject of Cardiology —THE CANADIAN JOURNAL OF MEDICINE AND SURGERY

OXFORD UNIVERSITY PRESS, Amen House, Warwick Square, London, E C 4

CALEDONIAN

How We Assist in the Purchase of Medical Practices

Scotland's Oldest Insurance Company is prepared to assist Doctors in the buying of Medical Practices or Partnerships The purchase price is repayable over a term of years, and a Life Assurance Policy is taken out as a collateral security This scheme makes it unnecessary for a Doctor to approach his friends to act as guarantors, and enables him to pay for his practice out of income After the repayment of the loan, the Life Policy becomes a valuable asset to the Doctor

Many Doctors have already established themselves in practice with the aid of the "Caledonian" Scheme The Interest Rates are particularly moderate *The Accountant's charges for investigating the practice and the Legal Fees for preparation of the deeds and documents in connection with the Loan are paid by the Company in completed cases* Arrangements can be made to meet special cases

Full particulars on application to the Head Office or to any of the Company's Branch Offices

TWO NEW EDITIONS OF FAMOUS WORKS

BUCHANAN'S Manual of Anatomy

REVISED BY PROFESSOR J E FRAZER

A sixth edition of this famous textbook is now ready in which for the first time the new British terminology has been used The book has been very largely rewritten, but the regional scheme of arrangement has been retained as experience has proved it to be by far the most convenient method for the student Embryology and Histology are both very fully covered, making the book a comprehensive work of reference of lasting value, as well as a first rate textbook for the student This new edition now contains 230 more illustrations than its predecessor, while many of the old figures have been redrawn Some hundreds of the illustrations are now in colours Sixth edition, Pp x + 1,782, with 1,041 illustrations, price 35/, postage 9d, abroad 2/4

TREDGOLD'S Mental Deficiency (Amentia)

BY A F TREDGOLD, MD, FRCP

In order to bring this 'Encyclopaedia of Mental Deficiency' up to date the chapters on Aetiology, Psychology Pathology, Secondary Amentia and Sociology have been extensively rewritten while considerable additions have been made to those on the Nature of Mental Defect, Clinical Examination Mental Tests, Diagnosis and Legal Procedure A section has also been added on the chronological development of the normal mind and the whole book has been subject to a thorough revision Many new plates are included Sixth edition, Pp xvi + 556 with 14 tables and 34 plates, price 25/ postage 6d abroad 1/3

A book which is indispensable to those who wish to have authoritative information and reliable opinions and judgements on the subject with which it deals It is a book to be read as well as a work of reference which it would be wise always to have at hand —BRITISH MEDICAL JOURNAL

TWENTY-FIVE per cent. of the flour from which the HOVIS loaf is produced is wheat germ

Science advocates the use of germ-bread as a factor in promoting nutrition That is why HOVIS figures so prominently upon the dietary when the question of food value must be studied In white bread, the wheat-germ is practically non-existent This vitalising source of protein, fats and phosphates abounds in HOVIS In fact, twenty-five per cent of the flour from which the HOVIS loaf is produced, is WHEAT-GERM Apart from its low starch-content, HOVIS is practically free from bran and indigestible cellulose This factor makes HOVIS supreme for easy digestibility and assimilation

VITAMIN 'B' CONTENT: HOVIS 2,600 WHOLEMEAL 1 450 WHITE BREAD 200

MIST. DAMIANÆ CO.

(HEWLETT'S)

In all the various forms of loss of nerve power Mist Damianæ Co (Hewlett's) is a powerful remedy, relieving the exhaustion and conferring renewed capacity for mental and physical endurance

Its alterative effects on the alimentary canal are most marked, and as a brain stimulant and nerve tonic it is unequalled

Its invigorating properties will be found invaluable in many diseases where there is great exhaustion In the frequent cases of nervous depression following influenza it has been prescribed with great benefit In paraplegia, hemiplegia, and partial paralysis it is particularly indicated

NO 'DIASTATIC' ACTION

Partial Cooking Destroys Rancidity . . .

Analysis shows that HOVIS has the advantage over white bread in being richer in salts It contains, in addition, more edible fats and a higher percentage of protein than either white or whole meal bread After mechanical separation from the bran and endosperm, the pure wheatgerm which gives HOVIS its added nutrition is subjected to the action of superheated steam This partially cooks the germ and entirely destroys the 'diastatic' properties which cause rancidity

more nutrition
greater digestibility

MANDELIX

(Elixir of Ammonium Mandelate B D H)

In Urinary Tract Infections

In the report (Proc Rvl Soc Med, February 1937, p 501) on a discussion on urinary antiseptics in which the 'surprisingly good results' which follow the administration of mandelic acid in the treatment of B coli infections are commented upon, it is stated of mandelic acid preparations that 'ammonium mandelate in the form of an elixir seems to be the most suitable, and less likely to require the addition of another urinary acidifier'

An elixir of ammonium mandelate in a highly palatable form is presented in Mandelix which contains in two fluid drachms the equivalent of the full therapeutic dose of mandelic acid, its administration provides a dependable alternative method to that of sodium mandelate and ammonium chloride

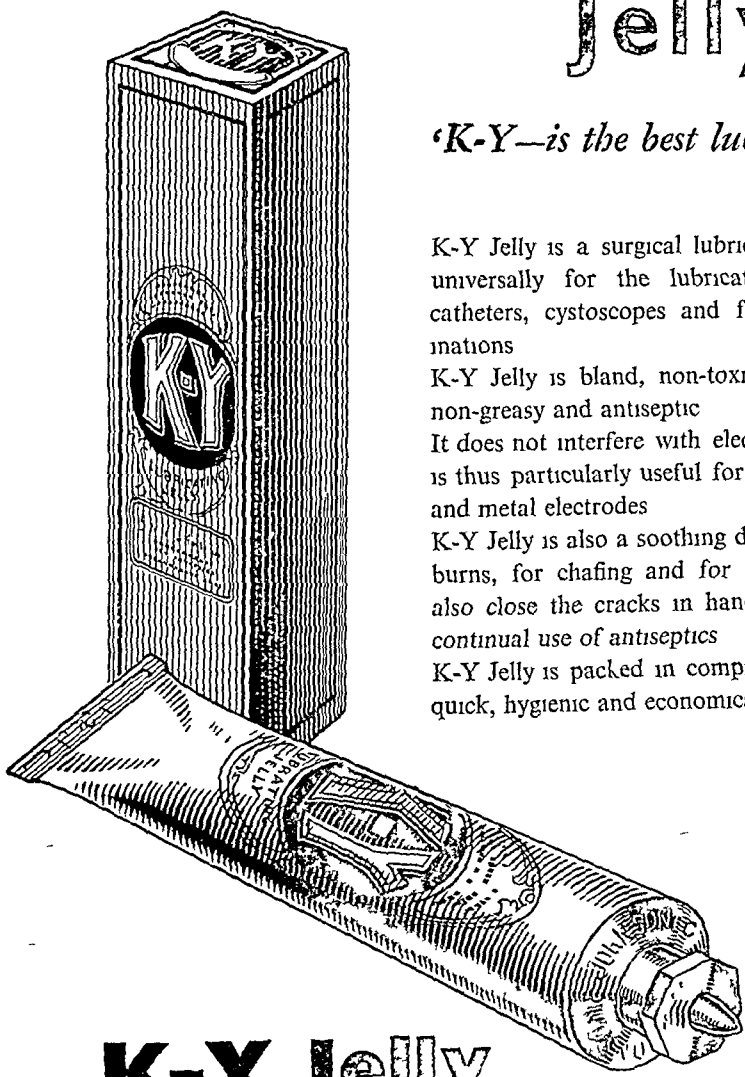
A step in the right direction

New Cocoa process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here Because it achieves this end without adding one penny to the cost of meals we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man

This new predigestion process makes for improved nutrition in two ways —

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly It now makes even milk three times as digestible The increase in digestibility is particularly noticeable with the enzyme erepsin, making this improved cocoa particularly beneficial to children Practically no indigestible protein now passes into the large intestine thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided



2 The protein in Rowntree's Cocoa is now more digestible than that in other cocoas This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children

★ ★ ★

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way The price is also unchanged

ROWNTREE AND COMPANY LIMITED, YORK

K-Y Lubricating Jelly

'K-Y—is the best lubrifacient'

THE LANCET

K-Y Jelly is a surgical lubricant used almost universally for the lubrication of sounds, catheters, cystoscopes and for digital examinations

K-Y Jelly is bland, non-toxic, water soluble, non-greasy and antiseptic

It does not interfere with electric current, and is thus particularly useful for lubricating glass and metal electrodes

K-Y Jelly is also a soothing dressing for minor burns, for chafing and for pruritus It will also close the cracks in hands roughened by continual use of antiseptics

K-Y Jelly is packed in compressible tubes for quick, hygienic and economical application

Improved Lubrication Therapy

THE advantages of lubrication therapy over the more or less drastic depuratives are too well known to require reiteration Physicians have however experienced the disadvantages which ordinary medicinal paraffin possesses—viz uncleanly in use unpleasant insipidity and risk of leakage"

Cristolax brings a new efficiency to the technique of lubrication therapy 50 per cent of liquid paraffin of the highest purity and optimum viscosity is so skilfully incorporated in Wander Dry Malt Extract that every vestige of disagreeable oiliness is completely eliminated

Cristolax is so pleasant to the taste that it can be prescribed with entire confidence for the most fastidious patient Its digestive and nutritive value render it of special service in constipation associated with defective assimilation dyspepsia and general debility

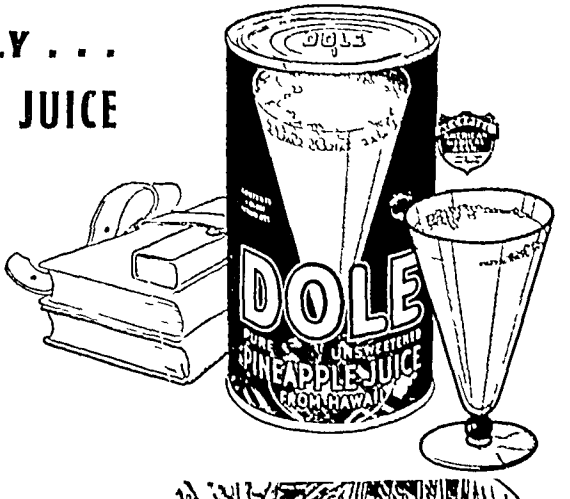
Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test
The Iron 'Jelloid' Co Ltd, King George's Avenue, Watford, Herts



SCHOOL CHILDREN *ESPECIALLY* . . . ARE FOND OF THIS PURE FRUIT JUICE

GOOD work as every doctor knows is very often dependent upon good health And a well regulated diet is important for maintaining good health

Dole Hawaiian Pineapple Juice is the natural juice of sun ripened Dole grown pineapple It contains no added sugar or preservatives of any kind

The exclusive Dole Cut Seal Vacuum Packing Process retains to a high degree those important fresh fruit constituents found in the ripened pineapple so valuable not only to growing children but to adults as well! Also this tangy tropical juice is a natural source of vitamin A B and C That's why with schooltime when parents are asking about diets and menus for their children you can recommend with assurance pure unsweetened Dole Pineapple Juice—the original pineapple juice from Hawaii

J K Husband & Co Ltd 10 Fasterheap London E C 3

HERE IS A TYPICAL ANALYSIS OF DOLE PINEAPPLE JUICE

Moisture	85 3%	Crude Fibre	0 02%
Ash	0 4	Titratable acidity as citric acid	0 9
Fat (ether extract)	0 3	Reducing sugars as invert sugar	12 4
Protein (N × 6 25)	0 3	Carbohydrates other than sugars (by difference)	0 38

P.S. We would like you to enjoy a long cool glass of this refreshing juice! Write to us on your letterhead and we will send you a sample tin free

THE LEI WOMAN —An old Hawaiian custom ever new is the habit of decorating departing or returning friends with beautiful wreaths of native flowers The fragrant ilima mauke plumeria pikake and ginger are used extensively in the making of leis It is a picturesque sight on steamer days to see the native women with their skilful hands weaving the fragrant garlands

HEPRONA

A new Haemopoietic Tonic

Containing

Vitamins B1, B2, and C
Colloidal Iron
and
the anti-anaemic principles of Liver

This combination will appeal to physicians as being rational in the treatment of

Secondary Anaemias, Neurasthenia, Neuritis and debilitated conditions generally.

In conditions of nervous exhaustion due to over-strain, in asthenia of the aged and whenever a general tonic is indicated, Heprona provides the necessary stimulus for normal reconstructive processes

DOSAGE

Adults —Two to four teaspoonfuls once or twice daily
Children—One or two teaspoonfuls

Heprona is issued in bottles of 6 fld ozs **4/6** each and 12 fld ozs **8/-** each

A Product of Evans' Biological Institute

Evans Sons Lescher & Webb Ltd.

Liverpool and London

OESTROFORM

In the treatment of menopausal disturbances

Some of the more severe symptoms of menopausal disturbances may require intensive treatment with Oestroform parenterally administered

Most cases however respond to treatment with Oestroform given orally Treatment should begin with small doses (1 000 international units two or three times daily) followed by rapidly increasing doses up to 10,000 units two to four times daily

As soon as the symptoms have subsided the doses should be decreased as rapidly as the reasonable comfort of the patient will allow

Such other conditions as kraurosis vulvæ may be treated with Oestroform per vaginam in the form of pessaries one being inserted once or twice daily

Oral and vaginal therapy may be carried out simultaneously

BALANCED ALKALINE MEDICATION

THE WIDER FIELD OF APPLICATION

THERE are many conditions which are sequela of or accompaniment to diseases in which the administration of alkalis is of definite benefit

Hyperchlorhydria, hyperacidity, nervous dyspepsia, together with acidoses and ulcers of the stomach and duodenum have always been considered as conditions for which alkali medication is indicated, but there are also pathological manifestations far removed from these conditions which have been found to respond to proper alkaline medication

Clinical experience has shown that the alkalies chosen in 'BiSoDoL' viz. sodium bicarbonate and magnesium carbonate, are therapeutically an ideal combination The sodium bicarbonate offers the system a readily available alkali and the insoluble basic carbonate provides pronounced alkalinizing powers against acidity as it arises The mixture presents a combination of unusual buffering agents and avoids therefore the possible danger of alkalosis which is associated with the administration of a single alkali

The depletion of the alkali reserve and the consequent disturbance of the acid base balance of the body, caused by diseases can therefore be compensated for by the careful use of 'BiSoDoL'

While the formula of 'BiSoDoL was originally evolved for the correction of acid conditions of the stomach, so suitable has it been found in balanced alkaline medication that it is now largely prescribed in this wider field

SPRAY ARGYROL IN COMMON COLD

BRAND SILVER VITELLIN

At this time of year, with frequent exposure to cold and wet, the common cold takes on a more serious aspect Tonsillitis, pharyngitis and sinusitis are frequent sequelae when "dread Winter spreads his latest glooms"

The prevention of complications is the first aim of the physician Early treatment with Argyrol Brand Silver Vitellin not only attacks the infection right at its source, but also quickly relieves the acute distress in the respiratory tract

The Dowling Argyrol pack and the Argyrol spray (20 per cent solution) have become standard therapy throughout the world Rhinologists, following the Dowling technique, find the tampon saturated with 10 20 per cent Argyrol solution, the most effective when used as a local detergent and decongestive for the highly inflamed nasal tissues The new Argyrol Brand Silver Vitellin tablets in small convenient vials are a great convenience in nose and throat practice They not only insure accuracy purity and genuineness, but also save

time, because a fresh, potent solution is thus made available at a moments notice in the doctor's surgery, in the operating room and at the bedside

Argyrol is a unique and original compound, no other silver salt is like it chemically

NEW YORK MONTREAL SYDNEY CAPE TOWN MILAN BOMBAY SHANGHAI BUENOS AIRES

H 3437

It will be noted that both under 2 years of age and over 2 the mortality is appreciably lower in Group A than in Group B thus suggesting that treatment in the open air is beneficial alike to the very young child and to older children suffering from pneumonia During a five year period it is difficult to imagine that one particular ward in a hospital should admit all the severe cases of pneumonia whereas another ward in the same period admits all the mild cases, but it is conceivable that this state of affairs might occur to some extent during one particular year, and for this reason Table III has been prepared

TABLE III—*Mortality Rate During the Various Years*

Year	Cases	Mortality Per Cent	
		Group A	Group B
1931 2	113	6 0	27 0
1932 3	93	13 5	19 5
1933 4	105	9 2	23 5
1934 5	124	13 4	17 5
1935 6	132	14 5	19 0
Totals	567	11 6	21 5

In this table the mortality rate in the two groups is shown during each of the five years and here it will be seen that although there is considerable variation in the mortality rates from year to year, in every instance the mortality in Group B is in excess of that in Group A Thus it seems reasonable to assume that the difference between the two groups cannot be explained by an uneven distribution of cases since the likelihood of this occurring during five consecutive years must be extremely remote

Another possibility that had to be taken into account was a discrepancy in the age distribution in the two groups and Tables IV and V show the age distribution and the mortality in Groups A and B respectively

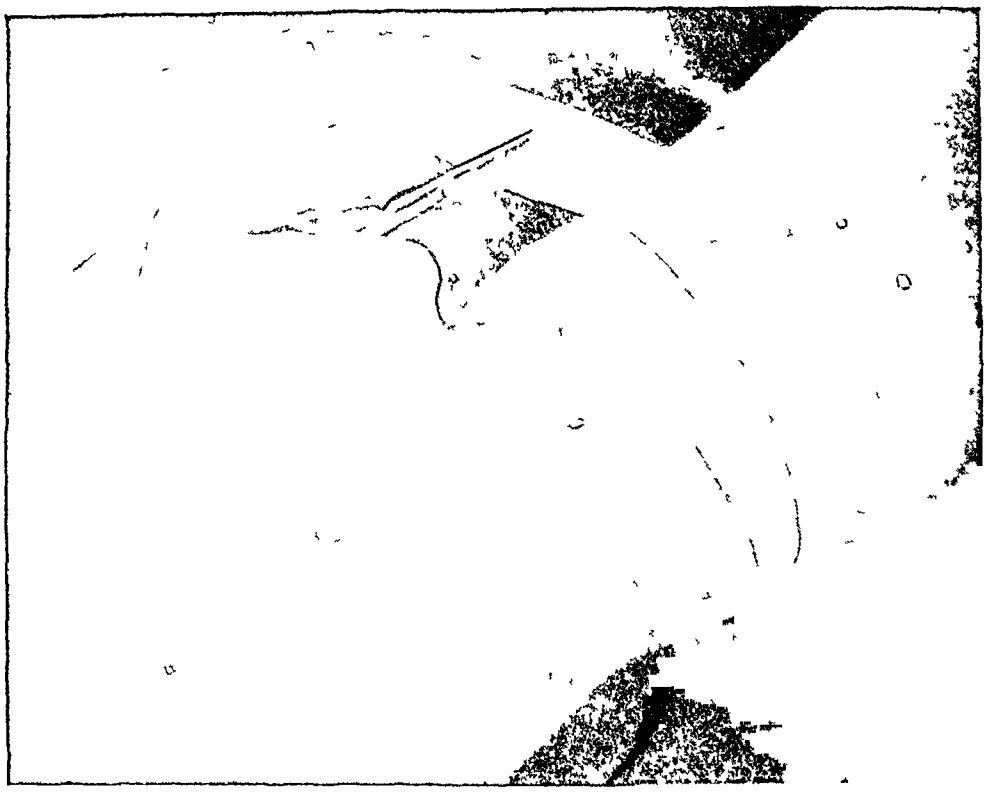
TABLE IV—*Mortality at the Various Age Periods—Group A*

Age Period	Cases	Deaths	Per Cent	
Under 6 months	14	10	71 4	
6 11 months	43	10	23 3	
12 23 months	77	10	13 0	8 6
2 5 years	97	3	3 1	
6 12 years	61	1	1 6	
Totals	292	34	11 6	

TABLE V—*Mortality at the Various Age Periods—Group B (Controls)*

Age Period	Cases	Deaths	Per Cent	
Under 6 months	25	21	84 0	
6 11 months	35	12	34 3	
12 23 months	76	18	23 7	15 2
2 5 years	84	8	9 5	
6 12 years	55	0	0 0	
Totals	275	59	21 5	

Study of these tables reveals the fact that Group B contains a relatively larger number of cases in which the children were under the age of 6 months and this will perhaps tend to raise the general mortality for the whole group since recovery from acute primary pneumonia during the early months of infancy is comparatively rare If the first age period is discounted in both groups however, it will be observed from the tables that the mortality still remains at a considerably lower level in Group A than in Group B It is suggested therefore that the figures shown in all the above tables, whether considered individually or collectively supply strong evidence in support of the favourable impressions formed at the bedside in connexion with the continuous open air treatment of pneumonia in children of all ages



Discussion

It has already been stated that the object of this investigation was to lay emphasis on one particular factor in the treatment of pneumonia in childhood While it is readily admitted that for many years writers both in this country and abroad, have advocated fresh air in the treatment of pneumonia, it is felt that the fundamental importance of this simple form of therapy is not sufficiently realized at the present day The open air treatment of pulmonary tuberculosis has long since ceased to be questioned, yet this simple but life saving remedy has not as yet been whole heartedly applied to other forms of respiratory infection Old traditions die hard and there can be little doubt that in many quarters it is still regarded almost as heresy to suggest that a child suffering from pneumonia accompanied by high fever should be nursed in the cold air

Comparison of the two groups of cases in this series would appear strongly to justify the intensive open air treatment in pneumonia in childhood but it must be emphasized that such treatment will lose much of its beneficial effect if it is carried out in a half hearted and timid manner All the children in Group A were exposed to a moving current of cold air immediately on admission to the ward and apart from adequate clothing were in no way protected from the draught Furthermore no distinction was made between bronchopneumonia and alveolar pneumonia the treatment being the same for both types and for all ages It is interesting to note that such treatment is not without physiological justification since Leonard Hill (1936) has demonstrated that exposure of the face to a current of cold air causes a reflex dilatation of the bronchi and bronchioles and this will tend to minimize respiratory distress and promote the maximum of aeration of the lungs The remarkable peacefulness and comfort of the child treated in this way is probably a factor in lowering the mortality owing to the minimum of strain being placed on the heart muscle The increased appetite also enables a sufficiency of nourishment to be given without constant coaxing and cajoling which can be so exhausting to a young child with pneumonia

One obvious objection to open air treatment carried out in hospital as described is the marked lowering of the ward temperature with a consequent danger to patients suffering from conditions other than pneumonia This applies especially to marasmic and grossly debilitated infants where it is frequently difficult to maintain the body temperature at a sufficiently high level This real difficulty would be obviated if every children's hospital contained a special ward constructed according to sanatorium principles for treating cases of acute pneumonia In view of the large number of respiratory cases admitted to hospital each year such a plan would be well worth while since it would probably be the means of saving many lives It is perhaps beyond the scope of the paper

No 16

Elastoplast in the treatment of displaced Semilunar Cartilage

Various methods of applying Elastoplast have proved successful, and are described in "Elastoplast Technique" The method illustrated leaves the back of the knee entirely uncovered yet provides excellent support For this purpose a one yard by three inch strip of plain Elastoplast Bandage is cut down the middle leaving about six inches uncut The uncut end is applied to the side of the knee, then over the patella and then bandaged with the strips above and below, each layer overlapping the previous layer The length of the strip can of course be varied—depending upon the amount of support required, and, if necessary, full width strips may be applied

A copy of "Elastoplast Technique" will be sent on request

to comment on the treatment of pneumonia in adults, but the view may be expressed that the continuing high mortality from this disease might be considerably reduced if the large general hospitals throughout the country were to provide better facilities for treating such cases in the open air. In the private house continuous open-air treatment can in the majority of cases be instituted with little inconvenience to other members of the household. Despite this there is frequently great reluctance on the part of parents to expose their stricken child to the cold air, and perhaps this reluctance could be largely overcome if the practitioner in attendance felt more strongly convinced of the great value of this harmless and easily applied remedy.

In this investigation the mortality rate only has been considered, and no mention is made of the effect of an open air regime on the duration of the fever or the incidence of complications. These questions and certain others are at present being investigated, nevertheless the actual mortality from pneumonia must remain the vital issue when judging the success or failure of any method of treatment, and it is a sincere belief in the life-giving qualities of the airs from heaven' which has prompted this paper.

Summary

The importance of open air as a therapeutic measure in acute primary pneumonia in children is emphasized, and the belief is expressed that the value of this remedy is not sufficiently appreciated at the present day.

A comparison is made between a series of cases treated according to an intensive open air regime and a control group of cases treated by other measures.

Exposure to a moving current of cold fresh air throughout the whole febrile period is advocated in all types of pneumonia in children of all ages, and it is suggested that if this simple and harmless expedient were to supersede certain of the more meddlesome forms of therapy frequently employed the lives of many children would be saved.

Hill, L. (1936). *J. Physiol.* **87**, 45 P.
Ker, C. B. (1904). *Scot. Med. and Surg. J.* **14**, 33.

Samuel Meaker (*J. Amer. med. Ass.* December 5, 1936, p. 1847) discusses the treatment of human sterility. He states that all recent advances are based on a better understanding of the aetiology, which in the majority of cases is not one single defect but the summation of several factors. Absolute sterility is found clinically in only 30 per cent. of cases, the remaining 70 per cent. showing only a group of factors tending to depress fertility below the threshold of conception. These factors are so rarely limited to one patient that Dr. Meaker has ceased to speak of sterility in man or woman but only of a sterile mating. Excluding rarities he considers the following the important factors of infertility: (*a*) genital hypoplasia, the organs showing the differentiation of a girl of 10 with ovarian immaturity and imperfect or absent ovulation; (*b*) abnormal viscosity of the endocervical secretions of chemical or infective origin; (*c*) partial or complete obstruction of the Fallopian tubes; (*d*) deficient oogenesis due either to depression in ovarian or pituitary secretions. Effective treatment is assured by complete diagnostic study. Male sterility can be examined by an accurate evaluation of semen. Endocervical infections are best treated by cautery; insufflation of gas and iodized oil only relieves partial obstruction and salpingostomy may establish patency of the tubes. Deficient oogenesis calls for the services of the endocrinologist and whereas hypophysin once established can benefit little. Dr. Meaker believes that herein lies an opportunity for preventive gynaecology by proper attention to menstrual behaviour and to the health of the adolescent girl.

AUDITORY NERVE SECTION IN MÉNIÈRE'S DISEASE

BY

R. RUTHERFORD, F.R.C.S.

The object of this investigation was to determine whether an accurate estimate of the depth of the internal auditory meatus from the outer table of the skull could be made before opening the skull, and if this was achieved to advocate the division of the eighth nerve when indicated through an operating endoscope in much the same way as one would use a cystoscope in the urinary bladder, thus reducing operative trauma to a minimum. If a suitable endoscope could not be devised it was thought that it might be possible to slip a flat graduated retractor into the subdural space, and when the calculated depth was reached to retract gently and find the foramen at once.

Preliminary Investigations

A preliminary investigation was made at the Museum of the Royal College of Surgeons some fifty Egyptian and North American Indian skulls being measured with a view to finding a common factor whereby the depth could be estimated. The bi-mastoid diameter and the internal auditory meatus chord were correlated with the following results:

44	per cent. of skulls had the factor	26
16	"	25
12	"	23
8	"	21
6	"	28
6	"	22
4	"	24
2	"	30
2	"	29

In the above measurements the point taken on the mastoid process was situated at the upper and posterior part in the same horizontal plane as the internal auditory meatus. From the point of view of a consistent factor, and the difficulty of deciding which point on the mastoid process should be taken since the internal auditory meatus in the intact skull is invisible, the above factors have no practical value.

Other tentative measurements were made and it was found that when one pair of supra-orbital notches was present the distance between each notch corresponded in the majority of cases with the distance between each internal auditory meatus, this was even true of the artificially deformed skulls of the North American Indians, these being flattened from before backwards and from above downwards, so that the bi-mastoid diameter is widened. The latter measurements it was felt did not lend any practical assistance because of the absence of one or both supra-orbital notches in a small percentage of skulls.

Dr. G. M. Morant, lecturer on anthropometry at University College, London, very kindly made a full statistical inquiry on a large number of English skulls at his disposal (100 male and 100 female). He found that an accurate estimate of the depth of the internal auditory meatus could be made from an external measurement, that external measurement being the distance between the asterion and the auriculare. To use his own words: "Taking all measurements in millimetres the required asterion-internal auditory meatus chord is obtained by multiplying the determined asterion-auriculare chord by 0·581 and adding 26·33. So that the equation, which can be applied to either sex and to either side, is

BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 27 1937

EFFECT ON THE EYE OF RADIUM USED FOR TREATMENT OF MALIGNANT DISEASE IN THE NEIGHBOURHOOD *

BY

PHILIPPA MARTIN, M S , F R C S

Ophthalmic Surgeon Hospital for Epilepsy and Paralysis Maida Vale
Assistant Surgeon Western Ophthalmic Hospital

At University College Hospital in 1931 it became clear that profound changes could be caused in the eye by radium used for the treatment of malignant tumours in its neighbourhood I therefore began an inquiry into the effects of radium on the eye among cases treated by the surgical staff of the hospital to whom I am indebted for constant encouragement and support

The tumours treated included basal cell carcinoma, lupus carcinoma and epithelioma of the skin meningioma and carcinoma and sarcoma occurring in the upper jaw Several of the cases had refused or were beyond the scope of operation

For the first two years treatment was by interstitial or surface irradiation with needles of low linear intensity, but since 1933 a 1 gramme radium unit has been available Needles with a 0 5 millimetre platinum screen were used at the beginning but the experience gained in the first six months led to the substitution of these so far as possible by needles with a screen of 0 8 millimetre platinum for all cases in which it was necessary to introduce radium into the orbit

I have included the late results of a few cases treated ten years ago with radium needles of high linear intensity and light screenage

Conjunctival Reaction Early Effects

When malignant disease in the neighbourhood of the eye is treated by interstitial irradiation with radium a series of morbid changes may be observed in the eye The main effect falls on the conjunctiva and skin of the lids, the eye itself, with the possible exception of the lens, being somewhat radio resistant

The first sign of any damage to the eye is a change in the appearance of the conjunctiva The reaction of the conjunctiva to radium is characterized by oedema, hyperaemia and a serous discharge On account of the laxity of the subconjunctival areolar tissue the oedema of the bulbar conjunctiva may be intense With an average therapeutic exposure the reaction begins a few hours after insertion of the radium and reaches its maximum between the fifth and eighth days, fading slowly to normal about three weeks later

When the conjunctival sac is irradiated uniformly the whole conjunctiva will become oedematous but the swelling will be greater in the lower fornix on account of the influence of gravity When the radium is eccentrically placed intense chemosis on the exposed side of the eye may give place to a normal membrane on the other side of the same conjunctival sac Swelling of the conjunctiva may be so great after heavy irradiation that the lids are pushed apart and the glistening red swelling overlaps the lower lid and spreads across the limbus on to the cornea The upper lid may be so raised that the cornea is in danger of ulceration from exposure

Hyperaemia increases with the swelling and its greatest intensity marks the height of the reaction Whether the conjunctiva or the skin of the lids shows the greatest reaction in a given case appears to depend chiefly upon which of the two is nearer to the source of irradiation It has been observed that radium implanted into the orbit behind the eye can produce a severe conjunctival reaction without ascertainable change in the skin of the lids It is possible that oedema of the orbital cellular tissue may contribute to the swelling of the bulbar conjunctiva under these conditions for proptosis has been observed to follow interstitial irradiation of the back of the orbit by needles introduced through an opening in its outer wall In this case the eye came forwards as the conjunctival reaction developed and receded again as it faded A similar transient proptosis has been reported as the result of the introduction of radon seeds behind the eyeball

Whilst the conjunctival reaction is still increasing a serous discharge from the conjunctival sac appears usually between the third and fifth days after irradiation is commenced This discharge is not in proportion to the degree of reaction, and may be slight even in those cases which show severe chemosis with a skin reaction Sometimes the discharge may be sanious especially where the neoplasm has involved the conjunctiva Often the discharge becomes muco purulent and the normal conjunctival reaction is masked by a true inflammatory conjunctivitis of minor degree This complication is seen usually where a pathological micro organism is found in the conjunctival sac before irradiation and especially where the eye has been closed either by a severe radium reaction or as part of the treatment

Pain is not a feature even of a severe conjunctival reaction Pain during the stage of active and subsiding conjunctival reaction suggests the onset of irradiation iritis The patient complains of stiffness and pricking in a normal conjunctival reaction Conjunctivitis increases the feeling of irritation without causing actual pain

A severe localized reaction results when radon seeds are used in close proximity to the conjunctiva The reaction reaches its maximum during the first days after the seeds have been implanted

* Hunterian Lecture before the Royal College of Surgeons of England Based on work done during tenure of the Percival Alleyn Scholarship for Research in Surgery at University College Hospital

Asterion–internal auditory meatus = 26·33 + 0·581 asterion–auriculare

Dr Morant has compiled complete tables for the distances required for different values of the asterion–auriculare chord, so that in practice these tables would be used and calculation would be unnecessary

Surgical Anatomy

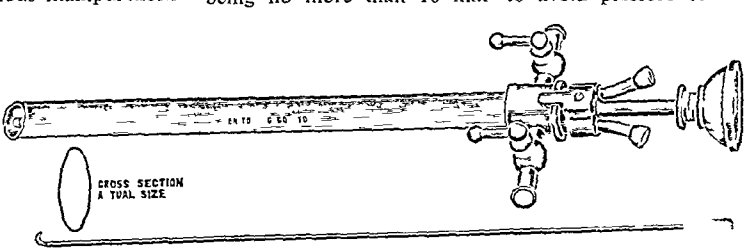
The *posterior cranial fossa is bounded* above by the tentorium cerebelli anteriorly by the posterior surfaces of the petrous portions of the temporal bones and by the basi sphenoid and laterally inferiorly, and posteriorly by the appropriate parts of the occipital bone, which is comparatively thin where it forms part of the base of the skull, the only anatomical abnormality likely to be met with is a diminution in size or entire absence of one or other lateral sinus in which case the sinus on the opposite side is correspondingly enlarged, an emissary vein near the mastoid process may give trouble but is readily plugged by means of a spicule of bone driven into its foramen The normal lateral sinus runs horizontally outwards from the torcular Herophyli, and takes a sharp turn downwards at the mastoid process, it is within this angle that the trephine hole is made so that the approach to the internal auditory meatus is *straight and involves* the least instrumental displacement of the cerebellum posteriorly The internal auditory meatus lies on the posterior surface of the portion of the temporal bone near its apex, and at a depth which can be predetermined its centre, in adult skulls, lies 5 mm below the attached border of the tentorium cerebelli, and through it are transmitted the facial nerve the pars intermedia, and the auditory nerve, in that order from above downwards There is a safe distance of 10 mm in adult skulls between the point of entry of the nerves into the meatus and the brain stem in other words it would be safe to sink a streamlined endoscope or flat retractor 10 mm beyond the calculated measurement before coming in contact with the brain stem

Physiology

If it is intended to introduce a cranioscope through a minimal opening in the posterior cranial fossa it may become necessary owing to the limited field of vision to identify the nerve strand seen by utilizing the fact that there is an action current in the auditory nerve when the auditory apparatus receives a physiological stimulus it being assumed, of course that the various manipulations are carried out under local anæsthesia, and that the cochlea is not so diseased as to be incapable of reception A silver electrode passed down the operating tube of the cranioscope and resting on the eighth nerve and the indifferent electrode engaging at the back of the neck would suffice, when the sound stimulus was applied, to operate a string galvanometer and put the identity of the nerve beyond doubt this confirmation is perhaps more of academic than practical interest, as no doubt an optical instrument can be devised to take in the whole field of the internal auditory meatus and identify the structures in their anatomical relations

Operation

A female, aged 65 years, a classical case of Meniere's disease was referred to me for operation



An obstetric dose of avertin was supplemented by ether inhalation One and a half ounces of ether were used during the one and three quarter hours operating time

A flat malleable retractor was marked the distance between the tip and the mark being the distance between the internal auditory meatus and the posterior superior border of the mastoid process of a prepared skull

A transverse incision was made stretching from the upper part of the posterior border of the mastoid process slightly curved with the convexity of the curve upwards and going down immediately to bone and finishing at the external occipital protuberance The muscles attached to the base of the skull were elevated and a half inch trephine hole was made about the centre of the right half of the occipital bone this hole was carefully enlarged by nibbling forceps forwards to the posterior edge of the right lateral sinus and upwards to the tentorial attachment the extent of the opening being two inches in lateral extent and one and a half inches in antero posterior extent The bleeding from the scalp was controlled by immediate ligature as the orthodox scalp forceps were found to be too cumbersome during the subsequent steps of the operation The only troublesome bleeding from bone was that from the mastoid emissary vein and this was easily controlled by a spicule of bone thrust into the foramen The dura mater was next incised at the forward end of the skull opening and the marked retractor slid very gently and very slowly into the subdural space until the mark was flush with the outer table gentle traction backwards of the cerebellum immediately revealed the internal auditory meatus with the facial nerve above and the auditory nerve below, the latter was divided by tenotome The patient was not at all shocked by the operation and the day following was able to tell us she was quite free from giddiness and nausea and needless to say was stone deaf on that side She developed suppurative parotitis ten days following the operation, and succumbed on the fourteenth day

The Suggested Cranioscope

With the kind collaboration of the Genito Urinary Manufacturing Company Ltd, an operating endoscope has been devised, the telescope and lamp are contained in an oval sheath with the long end tapered and still *maintaining* the oval section The cross section of the sheath is approximately 1 2 in by 3/16 in The central portion of the lumen is occupied by the telescope and lamp leaving good sized irrigation channels on either side In the sheath the irrigating channels are large enough to accommodate the small hook knife without the latter interfering much with the flow of the irrigating fluid The sheath is marked out in millimetres on the ventral surface zero starting at the lens system and the distance between the lens system and the long end being no more than 10 mm to avoid pressure on the brain stem The attached illustration does not show the subsequently modified long end which would scoop out the brain tissue when introduced the incorporation of a long end designed like the end of a flattened dessert obviates this

Conclusion

The section of this paper dealing with the proposed use of a cranioscope is I believe original it practicable it would seem to open up an avenue of observation on brain surface appearances in cerebral lesions in the living

When the eye is irradiated by a 1-gramme radium unit the conjunctival reaction is slight This observation has been made on cases of carcinoma occurring in the upper jaw in which the eye was displaced upwards by the growth before irradiation was commenced Treatment by the bomb varied from twenty to forty eight hours, but in each case the eye was directly exposed to irradiation and on account of the involvement of the orbital plate of the maxilla in the growth an additional screen applied to the eye direct would have rendered the treatment less efficient The conjunctival reaction reaches its maximum after about sixteen or eighteen days at the same time is the maximum skin reaction is seen Some chemosis occurs with little hyperaemia but the degree of swelling is not sufficient to prevent normal blinking Even where the skin reaction has been so intense that moist desquamation has resulted the conjunctival reaction is of a minor degree

Fading of the conjunctival reaction after interstitial irradiation is gradual Usually the hyperaemia disappears, leaving a straw coloured area of oedema of the conjunctiva This returns to normal in about three weeks after removal of the needles Even the chemosis of the conjunctiva caused by a tumour near the orbit will disappear after irradiation provided that the tumour has been adequately treated Conversely if chemosis of this type together with some or all of the additional chemosis associated with the radium reaction persists after irradiation there is a strong presumption that treatment has been inadequate Sometimes and especially in those cases where radium needles are used very near the conjunctiva, large superficial conjunctival vessels may persist permanently or may appear some weeks after the conjunctival reaction has faded This telangiectatic effect is not usually accompanied by a discharge

Conjunctival Reaction Late Effects

A severe conjunctival reaction may be followed by scarring of the conjunctiva Three to four months after interstitial irradiation the conjunctiva begins to thicken and shrink and often adheres to the sclera The normal transparency is lost and the thickened conjunctiva may in the course of years become densely white Where a localized reaction has occurred this effect may be confined to the corresponding area In some cases a thickened band of white conjunctiva passes from the inner side of the lid to the globe so that movement of the latter away from the scar is limited Contraction of the scar is so gradual that diplopia is not noticed by the patient though it may be elicited on examination

If the whole of the conjunctival sac has been irradiated equally with a relatively large amount of radium and the needles have been inserted into the orbit in close proximity to the conjunctiva the whole of the conjunctival sac will be involved in the process The fornices become obliterated and the thickened conjunctiva passes directly from the lids on to the sclera to which it becomes so firmly adherent as to restrict movement of the globe in all directions If an excision of the eye becomes necessary this adhesion makes it difficult to separate the conjunctiva from the sclera Healing of the incision in the damaged conjunctiva may take months After the eye has been removed the conjunctiva shrinks so completely that during the second year after irradiation only a narrow pink crack can be seen when an attempt is made to separate the lids

After the use of radon seeds localized conjunctival scars accompanied by injection of the conjunctival vessels are very common These scars may be confined to the bulbar conjunctiva Thickened folds of conjunctiva radiate from a depressed centre which is adherent to the underlying sclera

After irradiation with the 1 gramme unit the degree of scarring of the conjunctiva is negligible The change in the conjunctiva is more in the nature of a slight loss of elasticity and going rather than a pathological process No case in which the blood vessels have been permanently enlarged has been observed but occasionally the eye has remained slightly red for some months

Scarring of the lid margins is common after interstitial irradiation but damage to the lacrimal plate has not been observed The whole or a part of the lashes may be permanently lost and when this occurs the edge of the lid becomes rounded so that the skin passes without appreciable change into the scarred conjunctiva

In one case movement of the eye was so much diminished that fusion between the rounded margin of the lid and the scarred conjunctiva occurred This conjunctiva was exposed in consequence of retraction of the lids, and gradually took on the appearance of skin

Irradiation may lead to such scarring of the skin of the lower lid as to produce cicatricial ectropion When of lesser degree the ectropion may be limited to eversion of the lower punctum The tears then run down the cheek In cases where the edge of the lid has become rounded the punctum is frequently obliterated and all trace of it disappears When localized irradiation for instance of a basal cell carcinoma near the inner canthus has obliterated one or both puncta the patient will have epiphora Where irradiation has been so intense as to abolish the secretory activity of the lachrymal gland epiphora may be absent in spite of obliteration of the puncta A small localized scar may result from the use of radon seeds in the lower lid The contraction of this scar may be so severe that a nick in the contour of the lid margin is formed which allows the tears to run over Scarring of the conjunctiva and lids is especially prone to follow the use of unscreened or lightly screened radium, but with increasing knowledge of its dangers these severe scars will be seen less often

After irradiation with the 1-gramme unit an analogous scarring of the conjunctiva and of the lid margin can occur, but the change is of a minor character Rounding of the lid margin with permanent epilation has only once been seen and in this case there was epiphora from eversion of the punctum

Involvement of the Iris

The cornea and iris are affected only by relatively intense irradiation and should in the light of present knowledge show no change as a result of radiotherapy No reaction has been observed in either as a result of treatment with the 1-gramme unit During the stage of radium reaction in the skin and conjunctiva discomfort only is felt in the eye Pain is a sign that the iris has been affected It is experienced during the first few weeks after the radium has been removed, when the conjunctival reaction has reached or has just passed its height

The changes which have been observed in the iris vary from a slight swelling—iris reaction—only measurable by failure of the pupil to respond to homatropine as fully as before irradiation, to a definite iritis characterized by posterior synechiae I have never yet seen K P The synechiae are formed in that part of the iris which is most exposed to irradiation They break down readily under the action of a mydriatic, and may do so of their own accord without treatment Irradiation iritis is distinguished from all ordinary forms of iritis by its tendency to resolve spontaneously without relapse

Radium Necrosis of the Cornea

The chief morbid change in the cornea is ulceration which may be a direct result of irradiation—radium necrosis—or may arise indirectly for one or more of the following reasons

The cornea may become relatively dry, because the secretory activity of the lachrymal gland has been reduced by irradiation

Closure of the eye may be prevented by massive oedema of the conjunctiva which has not been controlled by

A NOTE ON THE ADRENAL CORTEX

BY

L. R. BROSTER, D.M., M.Ch., F.R.C.S.

Surgeon to Charing Cross Hospital

AND

H. W. C. VINES, M.A., M.D.

Pathologist Charing Cross Hospital Institute of Pathology

Since the publication of *The Adrenal Cortex* (Broster and Vines) in 1933 and the endowment of a surgical research bed and fund at Charing Cross Hospital by Viscount Wakefield of Hythe the scope of our work and material has considerably increased. This has enabled us to extend our studies into the spheres of biochemistry and psychology.

It may be recalled that we had drawn attention to the presence of a differential stain—the Ponceau fuchsine stain—in the cells of the adrenal cortex in our patients with virilism who had been subjected to the operation of unilateral adrenalectomy. This stain has been corroborated by others, who have shown what we then surmised but now have also substantiated, that the stain is positive in the cortex of both adrenal glands. In a leading article following our publication it was suggested by the *British Medical Journal* that 'the substance so staining must be closely related to or even identical with the male hormone or its precursor.' We have now been working in this direction for some years, and consider it a matter of sufficient importance and of general interest to issue a preliminary note, and to state that we have been successful in detecting not only an androgenic principle in the urine of these patients but in isolating a new biochemical compound specific to virilism, of adrenal origin. An important corollary to these investigations is the fact that there is a diminution in both the androgenic principle and of this new specific substance immediately after unilateral adrenalectomy.

Biochemical Investigations

Only a short abstract of each biochemical investigation is here included since it is proposed to issue a second report on this work giving the full details.

The following is a report from Dr. Jocelyn Patterson of Charing Cross Hospital and Dr. Alan W. Greenwood of the Institute of Animal Genetics, University of Edinburgh.

Case J. K. (*a*) Pre-operative
(*b*) Post-operative

Investigations have been made of the 'free' male hormone (androgenic substance extracted from the urine without drastic hydrolysis) and 'bound' hormone (extractable only after drastic hydrolysis) with the following results:

(*a*) Pre-operative findings:
Free hormone: 8 international units.
Bound hormone: not estimated because at the time our attention was focused entirely on the free hormone.

(*b*) Post-operative findings:
Free hormone: 3 international units.
Bound hormone: 6 international units.

In the normal female urine the free hormone is entirely absent, but with regard to the bound hormone we have as yet insufficient data to indicate the normal range.

"The capon method has been used for assay, androsterone being taken as the standard for comparison (1 mg. = 10 international units). It will be appreciated that in the present state of our knowledge the figures are only of relative significance, but they suffice to show that the immediate effect of the operation is to cause an appreciable drop in the excretion of free male hormone, though it has not brought about its complete disappearance from the urine."

The following samples of urine were collected at Charing Cross Hospital, evaporated to a thick syrup, and dispatched to Professor G. F. Marrian and Mr. G. Butler of the University of Toronto:

Case J. K. (*a*) Pre-operative, 6 litres collected over ten days.
Case J. K. (*b*) Post-operative 2½ litres.
Case M. M. (*c*) Pre-operative, 6 litres collected over eight days.

Professor Marrian and Mr. Butler report as follows:

"The ether-soluble neutral fractions of both pre-operative samples of urine yielded a white crystalline substance which after repeated crystallization melted at 243–244°. Yields of 242 and 95 mg. of the unpurified substance were obtained from the concentrates (*a*) and (*c*) respectively. Acid hydrolysis of the urine concentrates did not increase the yield. The post-operative urine sample from J. K. contained only a trace of this compound. We have, in the course of other work in this laboratory, examined a large number of urine samples collected from normal men and pregnant and non-pregnant women, but we have never been able to demonstrate the presence of this new compound in such urines. It would appear, therefore, to be specific to virilism of adrenal origin.

"This crystalline compound analyses sharply for the formula $C_{19}H_{30}O_3$. It appears to contain one tertiary and two secondary hydroxyl groups. The main features of the constitution of this interesting compound have been elucidated and will shortly be published by us elsewhere. It seems possible that the new compound is closely related to the series of compounds isolated by several groups of workers from adrenal tissues."

The Adreno-genital Syndrome and Sexuality

Dr. Clifford Allen has established the fact that the adreno-genital syndrome may influence sexuality to a profound degree. A large percentage of the patients showing this syndrome also show sexual abnormalities, being mainly homosexual or having diminished heterosexuality. Operation may influence this enormously. Patients suffering from the adreno-genital syndrome who showed strong homosexuality have been changed to strong heterosexuality and those with diminished heterosexuality have had it restored to normality. It has been determined definitely that there are two types of homosexuality, one dependent on disease of the glands (the adrenal glands in the cases studied), and the other on psychical disease. Operation cures the former but not the latter, which may respond to psychotherapy. These studies demonstrate the relation between psychical and physical sexuality in a way which has not been possible before.

Conclusion

This advance places the surgery of the adrenal cortex on a par—as one would expect—with the other glands of the endocrine series—namely, that a hypersecretion of the two glands can be controlled by means of the removal of one, and that there is as yet no evidence that the remaining gland hypertrophies sufficiently to cause a return of the clinical condition.

preliminary apposition of the lids The exposed cornea will then become superficially ulcerated but will heal without a scar if it can be covered by the lids Pain is more severe than in radium necrosis of the cornea

At a later date if ectropion has followed irradiation, the lower part of the cornea may ulcerate from exposure, even without damage to the lachrymal gland

Radium necrosis of the cornea is the most serious result of irradiation, and is usually associated with radium necrosis of skin or bone It appears as a delayed reaction about three months after a single intensive irradiation, but the time of onset varies and is dependent on the intensity of the irradiation A severe necrosis may appear shortly after a repeated irradiation even where the initial treatment has been by the 1 gramme radium unit or by deep x ray therapy

Diminution of sensation is the earliest sign of damage to the cornea On touching the cornea lightly with cotton wool blinking is slower than in the normal eye This effect may appear within a few weeks, persist for months and disappear leaving the sensation of the cornea normal I have seen diminution of sensation of the cornea on one occasion follow intensive irradiation with the 1 gramme unit Normal sensation was eventually restored But diminution of the corneal reflex to light touch may prove to be the forerunner of a radium necrosis of the cornea

Radium necrosis begins with a loss of polish of the cornea usually at the centre but where the irradiation has been directed from the side the effect may be confined to the corresponding sector, the cornea at a distance being normal Within a few hours loss of polish is followed by the appearance of one or more small superficial ulcers which have a smooth base and undermined edges The process may be arrested at this stage but as a rule the ulcers spread slowly and coalesce to form one large ulcer, which may involve the whole cornea except for a narrow rim at the periphery Alternatively a single ulcer may extend by stripping up the epithelium so as to form one or more ridges radiating from its margin The summits of these ridges split and the edges of the splits become undermined

Up to this point radium necrosis of the cornea bears a strong clinical resemblance to neuro paralytic keratitis but differs from it in having a slower onset and a remarkable resistance to infection It is only after some weeks that the onset of a mild infection is indicated by punctate infiltration around the ulcer There is little reddening of the eye and no ciliary injection in the absence of iritis If the eye is kept covered and a mydriatic is used the ulcer may remain stationary and the patient comfortable for months The spread of infection in these eyes is so slow that it may be months before the ulcer begins to extend and to develop points of yellow exudate in its base With this there is increase of the punctate infiltration and deep striation appears in the cornea A mild iritis which yields readily to treatment, may be set up by an extension of the corneal infection

Pain is not an outstanding feature of radium necrosis Even when a large ulcer is present little complaint is made

Radium necrosis of the cornea tends to progress to perforation and when this occurs the anterior chamber is open to invasion by micro organisms from outside The natural resistance of the interior of the eye to infection must be considerable for it is usually some weeks before a mild enophthalmitis begins Radium necrosis of the cornea is an aseptic destruction by a physical agent When it perforates the edges of the opening do not necessarily contain pathogenic micro organisms though they are slow to heal because they have been irradiated These two factors probably account for the delay in infection of the whole eye

Occasionally a severe necrosis may take place quite rapidly The whole cornea separates painlessly I have seen this catastrophe in some of the earlier cases after repeated irradiation complicated by sepsis in the neighbourhood It was not associated with conjunctivitis In one case the cornea separated followed by the iris and lens The whole eye disintegrated so completely that there was no recognizable trace of the sclera three days later when the orbit was exenterated In another case sloughing of the cornea was followed by loss of the iris and lens with subsequent panophthalmitis

Repair of Damaged Cornea

Provided that the reparative powers of the cornea have not been destroyed healing will take place slowly When the ulceration is shallow and before the whole cornea is involved repair without opacity in about four months is possible For this it is essential that the condition be recognized early and that the ulcer be covered by tarsorrhaphy If a cornea which has been protected by tarsorrhaphy is irradiated it may still develop ulceration but heals without opacity A deep ulcer may take up to eight months to heal A dense leucoma may form with superficial vascularization of the cornea the density being proportionate to the depth of cornea lost A perforation of the cornea from radium necrosis has been seen to heal even without tarsorrhaphy Ultimately vision depends on the position of the corneal opacity on the degree of residual astigmatism and on the possible development of an irradiation cataract

Irradiation Cataract

Radium cataract is usually a late reaction to irradiation and appears two years or more after exposure No record has been found in the literature of an early radium cataract which became mature although one case has been reported in which small vacuoles were seen in the lens ten days after the insertion of two radon seeds One seed was near the lens and both were of high intensity The vacuoles disappeared within fourteen weeks

I have been fortunate enough to see one case of early mature radium cataract It followed an extensive interstitial irradiation the orbital part of which consisted of six 2 milligramme needles arranged symmetrically round the eye The lens was therefore irradiated heavily from all sides Three days after removal of the needles a few subcortical opacities of the radiating senile type were seen in the anterior and posterior parts of the lens Four weeks later 1·5 dioptres of myopia had developed and vision was slightly reduced by a fine uniform haze throughout the lens The senile striae had also increased Seven weeks after removal of the radium the cataract was mature The changes in the lens preceded and therefore were not secondary to the attack of irradiation iritis which followed

The typical irradiation cataract is a posterior cortical one It may follow exposure to various forms of irradiation and its occurrence has been recorded in the literature for the last thirty years The earlier examples followed exposure to x rays After exposure to radium it usually develops during the second and third years though its appearance may be delayed until the sixth year or later

Radium cataract begins in the posterior part of the lens with vacuoles which are not quite circular Fine spots and feathery lines appear among the vacuoles and all the changes extend outwards and forwards in the lens until there is a posterior opacity, with its margin denser than its centre The cataract may be arrested at this stage or may go on to maturity When it goes on to maturity striae of the ordinary senile kind are formed sometimes with vacuoles beneath the anterior capsule Fine punctate opacities appear scattered throughout the lens They are seen first in the part of the lens most exposed to irradiation The cataract becomes mature by the gradual evolution of these changes The mature radium cataract possesses no special features but if occasion arises is amenable to operative treatment

Among the early cases of this series there were two examples of late radium cataract both of which were mature when first seen Both were treated with needles of high linear intensity lightly screened with 0·3 millimetre of platinum In both

Clinical Memoranda

Psychosis Associated with Atropine Administration

The case is that of a man of 44 years unmarried, who had been working as a labourer in Australia for many years

The following history was given There had been no previous serious ill health but for some years he had been troubled with his eyes A few weeks after landing in England he consulted an ophthalmologist who diagnosed chronic glaucoma and he was admitted to hospital On the day after admission the right eye was trephined with complete iridectomy, and an atropine solution was used to wash out the eye Three days later the patient became confused and restless screaming and getting in and out of bed He believed that people were going to injure him and would not tolerate anyone near him Morphine 1/4 grain and hyoscine 1/100 grain, were given but had little effect and it was said that his delusions and hallucinations became more vivid He believed the nurses were going to nail him to a board and burn him He was transferred to Smithdown Road Hospital Liverpool and admitted to the special division on an order for temporary detention completed by a relieving officer

On examination he persisted in his persecutory delusions with regard to the last hospital and amplified them He said he had been given poisoned food that he had feared to go to sleep as they were waiting to kill him etc but that he had had no trouble since leaving there He was restless and excited The left pupil was dilated and inactive and the hands were tremulous Pulse rate was 130 and the tongue was dry and coated There was no evidence of lesion of the central nervous system

The same day he was seen by the visiting ophthalmologist Mr Broderick who prescribed boric lotion for the right eye and guttae pilocarpinae 1 per cent for the left eye The patient improved somewhat during the day becoming more composed and amenable

The following morning atropine 1/100 grain was injected subcutaneously One and a half hours later the pulse rate increased and the left pupil was widely dilated The patient would not allow the doctor to come near him saying that the latter had come to destroy him He was confused and disorientated as to time and place refused food and struck out at imaginary persons Two c.cm prostigmine were given and two hours later the pulse rate was 90 and the left pupil reduced in size The patient said he had been imagining things He took food well and later slept satisfactorily

The next day the pupil was again dilated and the pulse 120 He was tremulous and incoherent and made rambling statements about being burned to death because of his past sins and said that the whole ward was against him Two c.cm prostigmine were again given The left pupil contracted within one hour and the patient became calmer He said that his troubles were due to imagination He complained of his eyes aching but had no dryness of the mouth Micturition and bowel action were normal He said that at the previous hospital he had had pain in the eyes after each instillation of the drops and he ascribed all his troubles to the operation

There was no return of the delusions His emotional state became steadily more stable behaviour was normal and he was co operative in the ordinary routine of the hospital The blood Wassermann test was negative He was discharged from the hospital twenty two days after the date of admission arrangements having been made for further post operative treatment of the right eye

COMMENTARY

We are told by ophthalmologists that mental disturbance following eye operations and delirious states associated with atropine administration are not uncommon During the past five years no such cases have been admitted to the mental observation wards serving the area under the administration of the Liverpool Corporation The cases that do occur are no doubt very transient as a rule or of a degree that is manageable under ordinary hospital or home conditions Recent literature in this country at least reveals few apposite references and it was thought worth while to put this case on record

The amount of atropine absorbed by this patient is unknown but it will be noted that a history was given of the eye being 'washed out' with atropine solution for three days before the onset of mental disturbance This drug being one to which individual susceptibility is very variable it must be considered that in this case there was an idiosyncrasy

The clinical picture showed many points of similarity to delirium tremens There was no definite indication that the condition was a reaction to atropine and an injection of this drug was given to clarify the point in the knowledge that if atropine were the exciting cause its effects could be rapidly countered It would have been interesting to observe however the duration of the mental disturbance in the absence of any medicinal measures The history obtained showed no evidence of abnormality of personality before the present mental disturbance but the fact that the patient had so recently arrived in England and no previous associates were known prevented an adequate assessment of this factor

We are indebted to Dr J P Steel medical superintendent of the hospital, for permission to publish this case

Bilharzial Invasion of Appendix

I think the following case is worthy of being recorded

A European miner aged 28 was seen at midday He complained of an acute attack of pain in the right lower abdomen at 8 a.m with pain radiating down the right leg which felt lame He had vomited once

On examination classical signs of acute appendicitis were elicited—pain on pressure over McBurney's point rigidity of right lower rectus with absent right lower abdominal reflex cutaneous hyperaesthesia over right lower abdomen and with pain on pressure over left lower abdomen referred to the right side He also gave a positive Cope's obturator test Temperature 96 2 pulse 80

I performed an emergency appendicectomy and found that the appendix which was slightly inflamed and not adherent to any intra abdominal organ presented on its distal end a swelling the size of a hazel nut As I suspected this lump to be a neoplasm I sent the appendix to the South African Institute for Medical Research for histological investigation The following report was subsequently received Section of this appendix (nodule at extremity) showed the presence of chronic inflammation and fibrosis in response to a heavy deposit of bilharzial ova There is no evidence of neoplasia

I made a careful investigation into this patient's history but could get no evidence of bilharzial bladder infection He had never had pain in the bladder difficulty with micturition nor had he ever passed blood in the urine

Examination of the faeces by direct and concentration methods detected no bilharzial ova but dead and living ova of *Schistosoma haematobium* were present in the urine

The patient made an uninterrupted recovery after the operation and at the end of a heavy course of proprietary antimony preparation returned a negative test for bilharzia ova in the urine

patients the cataract developed on the side irradiated and the other eye remained clear After 1931 the platinum screen was increased to 0·8 millimetre for interstitial irradiation near the eye and in 1933 a 1 gramme unit became available Since then radium cataract has not been seen

It is probable that delayed radium cataract arises from interference with the nutrition of the lens caused by endarteritis and telangiectatic changes in the ciliary body As these changes are much less in degree after mass irradiation than after interstitial irradiation it is possible that late radium cataract may not follow its use but it is only four years since 'bomb' treatment was started at University College Hospital, and it is therefore too soon to be certain

It must always happen that many patients who suffer from malignant disease needing treatment by radium, die of their disease before there has been time for late radium cataract to develop

In this series of cases no changes have been seen in the fundus as a result of treatment of neighbouring tumours by interstitial or mass irradiation This is in striking contrast with the effect of radon used in the treatment of intra-ocular growths but, of course, these methods of irradiation are not strictly comparable

In no case has the other eye been damaged by or involved in any type of radium reaction

Management of a Case in which Damage to an Eye May Occur

When interstitial irradiation of the tissues round the eye is proposed the cornea is first protected by stitching the lids together is before division of the sensory root of the fifth nerve The degree to which the conjunctiva can swell is then limited by the pressure of the lids

As the closure of an eye always carries a tendency to conjunctivitis the eye is washed twice a day with normal saline without disturbance of the stitch holding the lids Muco purulent discharge necessitates more frequent irrigation The neighbouring skin where exposed to irradiation is protected from wetting by sterile vaseline Sterile vaseline is also smeared on the lid margins to prevent the lashes sticking together The metallic preparations such as silver or zinc should not be used, as they may give rise to secondary radiations

The stitch holding the lids together is kept in place until the skin reaction is definitely fading The tendency is to remove it too soon The swollen conjunctiva immediately fills the palpebral aperture and flows over the lower lid It then dries and so increases the discomfort of the patient If the stitch has been removed too soon an attempt must be made to close the eye by strapping the lids together Occasionally the lids will not meet and must be strapped across the prolapsed conjunctiva If it is not possible to cover the cornea with the lids a Buller's shield will keep it moist and protected from dust

When tumours in the neighbourhood of the eye are treated by the 1 gramme unit the conjunctival reaction is often so slight that stitching or even strapping the lids together is unnecessary In any case the onset of the reaction is so gradual that ample time is allowed for closure of the eye should this be required

If the eye is displaced by a tumour it will gradually resume its normal position after irradiation During this process any tendency to diplopia will be lessened if both eyes can be kept open

So long as the lids are stitched together the eye cannot be examined and the only clue to the state of the iris lies in the subjective sensations of the patient He may feel irritation stiffness or pricking as a result of the conjunctival reaction but pain suggests iritis The pain is worse at night when the pupil is contracted in sleep and may be very severe If the pain is relieved by homatropine the diagnosis of iritis is confirmed and treatment by atropine can be instituted The synechiae of irradiation iritis are lightly attached to the anterior lens capsule and give way easily, so that full dilatation of the pupil is soon obtained As irradiation iritis tends to resolve spontaneously without relapse the atropine can be reduced as soon as the pain is under control The mydriatic can be discontinued sooner than in the treatment of a true inflammatory iritis

All cases where the eye has been exposed to intense irradiation should be seen once a week during the first six months Radium necrosis of the cornea may begin about eight weeks after irradiation, particularly where the reaction has been so severe that an iris reaction or an irradiation iritis has occurred The cornea is examined for diminution of sensation as this probably precedes desquamation of the superficial layers The greatest loss of sensation will be in the sector exposed to the maximum irradiation Whenever it is thought possible that radium necrosis may occur the cornea is stained with fluorescein at each examination This is particularly important after repeated irradiation Shallow areas of necrosis give rise to so little pain and so little reddening of the eye that their existence may not be suspected unless the cornea is stained At this early stage the cornea may heal with palliative treatment alone

Healing without opacity is made much more certain by tarsorrhaphy but even then may take from four to eight months The lids should be split to secure firm union, and the stitches should be left in place for four weeks In the presence of infection or of progressive necrosis tarsorrhaphy offers the chief hope of preventing perforation

If the cornea perforates it is probably useless to try to save the eye Healing of the perforation is unlikely The usual result is an enophthalmitis of low grade, which only gives clinical evidence of its existence some weeks after the perforation Perforation of the cornea is an indication for removal of the eye Owing to the shrinking of the conjunctiva and of the palpebral aperture which follows irradiation an artificial eye cannot be worn

Conclusions

The observation of eyes which have been exposed to radium irradiation of destructive intensity has demonstrated a series of morbid changes leading progressively to radium necrosis of the cornea and loss of the eye

When treatment of neighbouring malignant tumours is by interstitial irradiation these changes can be reduced by adequate screenage of the radium needles

After mass irradiation by a large quantity of radium at a distance the damage to the eye is negligible

As greater quantities of radium become available and facilities for the use of mass irradiation become more widely distributed it is to be hoped that damage to the eye by interstitial irradiation will cease to be of more than historic interest

The lecture was illustrated by lantern slides The cases upon which it is founded are reported in

It has been decided to wind up the Zunz Fund and each of the thirty-four London hospitals which have received grants from this fund for the past thirty-eight years has been offered by the trustees its share of the capital which totals approximately £425,000 Wards maintained by the grants were named "Annie Zunz" The present distribution of the capital was provided for in the will of Siegfried Rudolf Zunz a wealthy merchant who died in 1899 The winding up of the estate was to take place on the death of a specifically named annuitant, which has now occurred

Reviews

A DOCTOR IN PEACE AND WAR

Scalpel and Sword By Sir James Elliott M D (Pp 215 7s 6d) London Angus and Robertson Dunedin and Wellington A H and A W Reed 1937

Few have deserved a knighthood better than Sir James Elliott He is a past president of the New Zealand Branch of the British Medical Association, consulting surgeon to the Wellington Hospital and a member of the New Zealand Board of Health During the fifty years he has lived in Wellington he has seen it grow from little more than a small settlement with primitive habits and manners to a fine city, and in its growth he has had an important share The first chapters of his *Scalpel and Sword* will give great pleasure to the older inhabitants, for it must recall to them many conditions with which they were familiar in their younger days As a student at Otago Sir James has many stories of the University staff and of their peculiarities, for it is evident that some of the professors were characters We should like to hear more of Tom Parker, whom Huxley taught at the School of Mines, then located at the very top of a high building adjoining the South Kensington Museum Parker carried with him the Huxleian tradition to Otago Did he also carry with him the insatiable curiosity which was so marked a feature of his student career? From Otago James Elliott proceeded to Edinburgh and before he qualified went to South Africa as a member of the V M S C, doing such good work as a dresser that he was awarded the Queen's medal with two clasps Of this campaign, its mistakes and merits he gives a most interesting account After returning to Edinburgh to take his M B he soon went home and was engaged in practice until the great war began when he again volunteered receiving a commission as lieutenant colonel in the N Z M C and becoming A D M S Central Command N Z Of this period he says little but confines himself to his experiences on the New Zealand hospital ship *Maheno*, experience which should be of service to every medical officer in case of any future war

Sir James enlivens his story with many anecdotes and witty sayings some new and some old The book concludes with a chapter on 'Roving in Maoriland," which we would gladly exchange for more reminiscences It may be noted that the volume is set up printed, and bound by the Hilstead Printing Company of Sydney, and can be obtained in London from the Australian Book Company 37 Great Russell Street, W C 1 The publishers Messrs A H and A W Reed of Dunedin and Wellington are to be as heartily congratulated on the technical result as is the author The type and binding are excellent and the contents most readable

A SURGICAL BOOK FOR STUDENTS OF DENTISTRY

Surgery for Dental Students By Philip H Mitchiner M D M S F R C S Clement F Shattock M D M S F R C S Edward G Slesinger O B E M S F R C S and Cecil P G Wakeley D Sc F R C S (Pp 364 105 figures 12s 6d) London Baillière Tindall and Cox 1936

In writing this manual the authors have essayed the difficult task of providing the dental surgeon with a work to which he can refer for practical guidance, and the student with a textbook containing the knowledge he will be expected by his examiners to possess In particular, they aim at covering the syllabus in surgery and surgical pathology of the Royal Colleges of Surgeons of England, Scotland, and Ireland, and of the universities of the British Empire

Frankly we do not think the authors have been able to combine the two objectives As members of the examining board in dental surgery of the Royal College of Surgeons of England they introduce and illustrate such conditions as fractures of long bones, tuberculous dislocation of the hip, sarcoma of the breast sacculated aneurysm, filling the book with descriptions of subjects which, however useful for examination purposes, will never come into the dental surgeon's hands On the other hand, the dental cyst, which is the commonest "surgical" affection the dentist sees, receives scant attention and is illustrated by the figure of a dentigerous cyst The book suffers from a common fault of a joint work by several hands—repetition It closes with a carefully considered chapter on anaesthetics by Dr A D Marston

The authors are concise and clear in all their descriptions of disease and treatment—our criticism is really a criticism of the surgical syllabus of the various corporations and universities which issue dental qualifications

SURGERY OF THE CHEST AND ABDOMEN

The Operations of Surgery Vol 2 The Abdomen By R P Rowlands M S, F R C S, and Philip Turner, B Sc, M S F R C S (Pp 998, 514 figures, 4 in colour 36s) London J and A Churchill 1937

The second volume of the eighth edition of this well known work deals with surgery of the chest and abdomen In its preparation Mr Philip Turner has secured from among his colleagues at Guy's Hospital the collaboration of Messrs Ralph Thompson, G F Gibberd and R C Brock, who write on their specialties of genito urinary surgery, gynaecology, and thoracic surgery respectively and of Mr W H Ogilvie, who writes on hernia and on the spleen and pancreas, anus and rectum, and on the preparation of the patient for operation At the end of the present volume a new chapter on some recent developments has been added This is an attractive feature, and it might with advantage be amplified in future editions In this section we are pleased to find a summary of Professor Grey Turner's important work on oesophageal resection We should like to have seen some reference to the management of brain abscess by the method of Clovis-Vincent (which in our opinion surpasses those methods referred to), and some mention of the dehydration treatment of cases of head injury and of cerebral oedema Where space is limited, however, the choice of what to add on new methods must always be difficult There appears to have been more complete revision in volume 1 than in volume 2 of this edition, and we hope that in future still further pruning will be done, a series of illustrations of the methods of carrying out gastropexy is surely only of historical interest to-day

The text is clear throughout and the descriptions are precise and easily followed The allusions to the history of certain operations are pleasing and the discussions of the indications for operations particularly valuable In this respect the chapter on appendicitis is one of the best in the book The volume is dedicated to Guy's Hospital, and we welcome it and its companion in this edition as a worthy successor to the original *Operations of Surgery* by W H A Jacobson, which first appeared in 1889 The many references to the surgical staff of Guy's will appeal particularly to Guy's men, but the work as a whole will prove a useful guide to any young surgeon who is confronted with problems relating to operative surgery

ISOLATION OF THE INFLUENZA VIRUS AND THE RELATION OF ANTIBODIES TO INFECTION AND IMMUNITY

THE MANCHESTER INFLUENZA EPIDEMIC OF 1937

BY

LESLIE HOYLE, M.B., Ch.B.*
Royce Research Fellow

AND

R. W. FAIRBROTHER, D.Sc., M.D., M.R.C.P.†
Lecturer in Bacteriology
(From the Department of Bacteriology and Preventive Medicine, University of Manchester)

The recent extensive epidemic of influenza has afforded an opportunity of confirming the observation of Laidlaw and his colleagues (1933) that the disease is due to a filterable virus. The failure to isolate strains of influenza virus during the past two to three years in Manchester has recently been reported (Fairbrother and Hoyle 1937). This was an interepidemic period, and our failure in this respect was similar to that experienced by other workers who have so far only isolated the virus from patients affected by the epidemic form of the disease. The present epidemic has consequently enabled us to obtain a plentiful supply of material and more extensive investigations have been possible. These have been directed mainly to (1) the isolation of the virus and (2) to determining the relation between the presence of antibodies and protection.

Isolation of the Virus

Saline broth washings from the upper respiratory tract and material expectorated directly from the trachea in cases in which tracheitis was an initial symptom were collected during the early stages of the disease and instilled intranasally into ferrets anaesthetized with ether. A careful bacteriological examination of all the specimens was made by the methods previously employed by one of us (Hoyle 1932) in work on upper respiratory infections, special attention being paid to the isolation of *H. influenzae*. There was no evidence of the participation of any one pathogenic organism in the epidemic. *H. influenzae* in particular was notably absent; it was demonstrated in only one specimen.

The inoculated ferrets were watched closely for the appearance of symptoms and regular temperature readings were taken. In all twenty-eight separate specimens from characteristic cases of epidemic influenza have been examined and in thirteen cases (46 per cent.) the typical infection developed in the ferret. In all instances the condition was passed serially in the ferret while regular attempts were made to produce lesions in mice. In the ferret the characteristic rhino-pharyngitis developed with nasal obstruction, laboured breathing, and pyrexia in thirty-six to forty-eight hours, the animals were then killed and material collected for passage. The general signs of infection were identical with those following the inoculation of ferrets with the W.S. strain of virus kindly sent to us by Dr. Wilson Smith.

The cases investigated by us are probably representative of the epidemic as they were obtained from widely scattered areas in the vicinity, some were from hospitals and others from general practice. In one case the original infection undoubtedly took place in London. It is interesting to note that direct tracheal exudates gave the best results, saline broth washings being much less successful.

The failure to isolate the virus from every case examined is probably largely due to a number of technical difficulties. In some instances the material received either was of an unsuitable nature or was delayed in transit. Also owing to shortage of ferrets, we were compelled to restrict our inoculations to one animal only for each case, and serial passage had to be reserved for those in which a typical infection occurred. Some ferrets that developed mild indefinite symptoms without fever were abandoned. We have little doubt that under ideal conditions the proportion of successful isolations of virus would have been much higher.

Identification

It is well known that there are two related but distinct strains of the influenza virus—human and swine. The human strain only has been isolated from human influenza. The swine virus, together with *H. influenzae* (suis), is responsible for swine influenza, a condition occurring in the Middle West States of America. It is serologically related to the human strain, having a common antigenic factor, and in view of the frequent presence of antibodies against the swine virus in adult human serum Laidlaw (1935) has suggested that the swine virus was responsible for the 1918–19 pandemic and that the human virus is concerned with the general epidemic form. It is therefore of some importance that the strains should be identified in view of the extent of the recent epidemic which has been practically of pandemic proportions. This identification is carried out most satisfactorily by quantitative neutralization tests in mice.

Attempts were made at each stage of ferret passage to infect mice with the strains isolated. This as other workers have reported is often difficult with the human virus but is less difficult with the swine virus. Our strains behaved in this respect as the human type, the first passage from ferret to mice often produced lesions but attempted passage of these was usually unsuccessful. Even after five to seven passages in the ferret mice could not be consistently infected. So far only four of the thirteen strains isolated have been satisfactorily adapted to mice.

We examined strains by neutralization in either ferrets or mice and found that they were all of the human type. The tests were carried out against an immune horse serum (I.H. 2 Laidlaw *et al.* 1935) and specific antisera collected from immunized swine by Dr. Shope. The results with the Manchester strains and the W.S. (Hampstead) strain were identical and indicate clearly that the human virus was responsible for the epidemic. The viruses were neutralized by the anti-human sera but not by the anti-swine sera.

Antibodies as an Index of Protection

Antibodies against the human and swine viruses can be readily detected by neutralization or complement fixation tests. They have been demonstrated in the serum of normal individuals, the percentage of persons with such antibodies being higher in urban than in scattered communities and increasing with age. They are specific for the virus and their presence is generally considered to indicate previous clinical or subclinical infection. We found (1937) that the complement fixation test was more suitable than the neutralization test for the quantitative examination of large numbers of sera. In this reaction however antigens made from the human and swine strains behave alike, this being due to the presence in the two viruses of a common antigenic component. This test does not therefore give any indication of the type of the infecting virus—that is whether it is human or swine.

THE MANTLE OF WHITRIDGE WILLIAMS

Williams Obstetrics By Henricus J Stander M D F A C S Seventh edition (Pp 1 269 729 figures 40s net) London D Appleton Century Co 1936

Dr J Whitridge Williams died in 1931 a year after he had completed the thoroughly revised sixth edition of his *Obstetrics* and so passed the doyen of obstetrics in the English speaking world It is fortunate that the publishers were able to secure the services of Dr H J Stander to bring out the seventh edition for of all men he is the most likely to safeguard the traditions of his teacher's masterpiece This edition follows closely the lines of the former but there has been some rearrangement of chapters, together with the addition of fresh illustrations Further, three new chapters have been added dealing with the hormones related to pregnancy and the puerperium the urinary complications of pregnancy and analgesia and anaesthesia in labour It suffices to say that the style and manner of presentation of the matter in these new chapters is worthy of the book and indeed the section on the hormones is one of the best and most succinct presentations of the subject of which we are aware A few typographical errors have escaped detection

There is no need to recommend a book so well known It possesses a breadth of vision, an almost Olympian attitude towards the subject that places it above the arena of controversy In spite of its great erudition it indicates a practical conservative, and dependable line of treatment for every obstetric emergency *Williams Obstetrics* has been by common consent for many years the outstanding book on the subject in the English language and it would be difficult to find its equal in any language The mantle of Whitridge Williams has fallen on Stander and there seems no reason why this book should not retain its unique position for another generation

LEPROSY IN THE CHINESE

Leprosy A Practical Text Book for Use in China By James L Maxwell M D (Pp 109 2 dollars (China) 4s abroad) Shanghai Chinese Medical Association 1937

Such a book as this by Dr James Maxwell is a sign of the greatly increased interest taken in leprosy during recent years New knowledge stresses the great variations in the type of leprosy cases observed in different countries of the world and in different races and as this small work is illustrated by good photographs of both early and late stages of the different types of leprosy in Chinese subjects it should fulfil the object of the author in providing a simple and practical book for use in the vast leprosy areas of China

The author has collected much information regarding the distribution of the disease, which shows the highest rates of incidence in the southern and south western provinces and in Shangtung in the north east quite irrespective of race or climate The symptoms and lesions are clearly described the Philippine Congress classification being adopted in spite of part of it being based in some degree on microscopical characters of the lesions making it unsuitable for Chinese conditions The author rightly stresses the primary importance of attention to the general health and the complicating debilitating diseases of the patients, and also to an adequate diet including abundant calcium The best methods of administering the usual chaulmoogra oil preparations are described and their value in early and in some of the more advanced cases is recognized The final chapter on village clinics and leper settlements, is of special interest on account of the author's extensive experience in visiting the institutions of various mission bodies in China He points out that settlements tend to keep alive hopeless and often uninfective cases at great cost, and he advocates numerous village clinics for the economical treatment of early cases with visits to the patients homes to advise and detect early cases as by far the most effective prophylactic method This book should prove of value beyond the limits of China

INDECENT PUBLICATIONS

Obscene Literature In Law and Practice By Sir E Tindal Atkinson K C B C B E (Pp 32 1s net) London Christophers 1937

At common law it has long been an offence to publish indecent books or prints The test of obscenity as laid down in R v Hicklin (1868, L R 3 Q B 367) is whether the tendency of the matter published is to deprave and corrupt those whose minds are open to such immoral influences and into whose hands the publication might fall Sir Edward Tindal Atkinson Director of Public Prosecutions recently delivered a most valuable lecture in which he dealt with the whole of the law of obscene literature and he has now reprinted it as a pamphlet it contains matter that will interest everyone in these times of insistence on extreme licence in literature It is obvious as he says that the standard must be a shifting one and that many books now published without comment would have been condemned in 1868 The offence is of course a statutory as well as a common law one The Vagrancy Act 1824 s 4, lays down that a person who wilfully exposes to view in a street or public place any obscene print or picture is a rogue and a vagabond and the amending Act of 1838 included exhibitions in shop windows Other Acts more or less repeat these provisions and the Public Health Acts (Amendment) Act 1907, s 81 makes it an offence to do any of these things in any place of public resort or unfenced ground abutting on a street The Obscene Publications Act 1857 is the Act which the police chiefly use in restraining the activities of small shopkeepers who sell indecent postcards as a side line A police officer has to swear before a magistrate that he believes that obscene prints are kept on the premises and that there actually has been a sale or publication there

From the medical point of view this branch of the law is particularly interesting in its application to scientific or pseudo scientific works The judge who tried Hicklin's case pointed out that a medical treatise with illustrations necessary for the information of students or practitioners would probably not be treated as obscene if published so as to reach only such persons though it might be if exhibited in a shop window for any passer by to see A far more difficult problem is presented by two classes of literature mentioned by Sir Edward Tindal Atkinson the publication of which has much increased during the past two years These comprise books which while masquerading under the guise of scientific works purport in extreme detail to lay before the public the subject of sexual relations and aberrations and books which under the guise of literature use sexual matters as colours in making a picture generally of modern life to such exclusion of other elements as to put sex in a wholly disproportionate and false position In the first place he says the publishers announcements pay lip service to the cause of science and in the second class the books range from purely and obviously pornographic works to novels in which for the purpose of adding to their selling value

We have recently examined a random collection of sera taken during the interepidemic period when influenza was rare. Antibodies to a relatively low titre were found in about 50 per cent. of the samples. A similar investigation was carried out on the serum of individuals two to three weeks after recovery from influenza and a marked increase in the antibody content was usually found. These individuals were not selected but were generally representative; the ages varied from 17 to 78 years, and in some instances they were suffering from chronic diseases such as pernicious anæmia. A comparison of the two series of results is given in Table I.

TABLE I.—*Complement fixation Titres of Normal and Convalescent Sera*

Titre	Number of Normal Sera (pre-epidemic)	Number of Convalescent Sera (post-epidemic)
1 in 128	0	9
1 in 64	0	13
1 in 32	0	14
1 in 16	2	10
1 in 8	15	11
1 in 4	60	8
1 in 2	63	0
Doubtful (1 in 2)	64	0
Negative (1 in 2)	96	0
Total number	300	65

There is a definite increase in the general titre of the convalescents. All had a titre of 1 in 4 or over, while with the normal sera some 75 per cent. gave a reading of 1 in 2 or under. This marked rise was not unexpected, as there is no doubt that convalescents possess a high degree of immunity to the virus. Francis and Magill (1935) have shown by neutralization tests that antibodies are specifically stimulated by infection with the influenza virus. The highest titre previously obtained by us during an examination of 300 normal sera was 1 in 16, and this had only been found on two occasions. In contrast to this several sera from convalescents gave a titre of 1 in 128. These results indicated that an advance in titre had followed the infection. In a few instances however, there was apparently little increase in the antibody titre. This is not unexpected as it is well known that the antibody response of individuals following a similar stimulus is very uneven.

An opportunity was afforded of examining the serum of individuals in a hospital ward in which there had been an outbreak of influenza. Samples were collected from cases of influenza and from individuals who had escaped infection. A high titre was found in the majority of convalescents and in most of those who had been clinically free from infection (see Table II). This suggests that possibly those who escaped were immune by virtue of the presence of antibodies and that in some the titre was augmented by subclinical infection. It will be noted that one person who had no detectable antibody escaped, and also that two others had a low titre (1 in 2).

TABLE II.—*Titre of Sera of Patients in a Hospital Ward Twenty Days After the Outbreak of Influenza*

Fixation Titre	Influenza Convalescents	Individuals Escaping Influenza
1 in 128	3	2
1 in 64	4	1
1 in 32	2	0
1 in 16	0	1
1 in 8	1	1
1 in 4	2	0
1 in 2	0	2
Doubtful 1 in 2	0	0
Negative 1 in 2)	0	1
Total	12	8

More definite evidence of the increase in titre following infection was forthcoming from an examination of individuals before and after the attack (see Table III).

TABLE III.—*Serum Antibodies Before and After Influenza*

Case	Titre of Complement fixing Antibodies		Presence of Neutralizing Antibodies	
	Before	After	Before	After
R. W. T.	0 (1 in 2)	+ (1 in 64)	0 (1 in 2)	+ (1 in 4)
M. H.	0 (1 in 2)	+ (1 in 64)	0 (1 in 2)	+ (1 in 3)
B. H.	± (1 in 2)	+ (1 in 32)	0 (1 in 2)	+ (1 in 4)
S.	± (1 in 2)	+ (1 in 8)		
McG.	± (1 in 2)	+ (1 in 4)	± (1 in 2)	+ (1 in 4)

0 = negative fixation or absence of neutralization
± = partial fixation or incomplete neutralization
+ = positive fixation or complete neutralization
The figures in brackets indicate the titre of fixation and the highest dilution tested by neutralization.

Although only a few cases were examined a marked increase in neutralizing and complement-fixing antibodies was found in all, in two of these cases (R. W. T. and M. H.) it is interesting to note that the virus was isolated from the patient.

The following point at once arose. Was the presence of antibodies any indication of resistance to infection? It is impossible to give a definite answer to this important question. Our results suggest, however, (1) that if complement-fixing antibodies are present to a titre of 1 in 4 or higher there is likely to be an associated clinical immunity, and (2) that other factors may be involved in resistance to infection.

We were able to test the serum of forty-four individuals at the beginning of the epidemic. The relation of the titre to the incidence of the disease is given in Table IV.

TABLE IV.—*Relation Between Fixation Titre and the Incidence of Infection*

Complement fixation Test Titre	Number of Sera	Number Developing Influenza
1 in 16	2	0
1 in 8	5	0
1 in 4	10	0
1 in 2	11	0
Doubtful (1 in 2)	8	3
Negative (1 in 2)	8	2
Total	44	5

Influenza developed only in those whose serum in a 1 in 2 dilution gave a doubtful or a negative reading. It may also be noted that some individuals whose serum gave a low reading did not become infected. As this might have been due to the presence of neutralizing antibodies which were not demonstrated by complement-fixation neutralization tests were carried out. Only one of the sera

semi indecent passages are purposely introduced Medical men will at once call to mind examples and probably will not be concerned to defend a publication which is more or less obviously designed to appeal to the unscientific interest of the public rather than to the scientific interest of the student As Sir Edward Tindal Atkinson said once in a memorandum on one of these cases, much of the detail in the book could justifiably find a place in a medical or historical work but it did not pretend to have any serious purpose, and it also illustrated the contention that the greater the ability with which the indecent picture is presented the greater is the danger to the mind of the reader

Even in these days there is no reason to doubt that many minds can be corrupted by disturbance of what the psychologist might term the sexual balance ' Whether a particular book transgresses or not is always a difficult question but few will disagree with the author s view that the number of cases in which art, literature, and science have really been aggrieved by the condemnation of a book is remarkably small

PREVENTIVE MEDICINE

Preventive Medicine By Mark F Boyd M D, M S Fifth edition reset (Pp 561 155 figures 20s net) Philadelphia and London W B Saunders Co 1936

The new edition of Dr Mark Boyd s book contains a good deal of new material Of the enlarged articles that on diphtheria refers to the administration of the alum-precipitated toxoid for the purpose of active immunization It is stated that the occurrence of local reactions in about 5 per cent of older children and adults is largely limiting the use of present day preparations to children under 6 in whom the one-dose method, subject to conditions is sanctioned by current practice In the article on encephalitis this disease is classified in accordance with a recent bulletin of the United States Public Health Service into (1) lethargic (2) epidemic including the Japanese and St Louis forms (3) other infectious types and (4) the post infectious forms such as post-vaccinial encephalitis In the article on poliomyelitis it is well said with regard to the various methods claimed to produce immunization that judgement of their value must be deferred In the article on malaria the uses of plasmoquine and atebrin respectively are adequately discussed Among other new or enlarged articles are those on ringworm, psittacosis tuberculosis typhus relapsing fever, and mottled enamel of the teeth This dental dystrophy which occurs among children in communities using deep wells in certain States of the Union is now known to be due to the presence of fluorine in the water The morbific proportion of fluorine is given as 0 9 part upwards per million of water

The fifth edition of this work like its predecessors, presents a lucid exposition of the views held in the United States on the subject with which it deals

Notes on Books

The *Transactions of the Ophthalmological Society* vol 56, is a volume of 442 pages with numerous diagrams and eight plates five of which are coloured The contributions are grouped under subjects and cover the whole field of ophthalmology Among the many interesting communications is a discussion on ophthalmia neonatorum, and papers on a Talking Book for the Blind and ' The Aetiology of Phlyctenular Ophthalmia The last 120 pages contain the reports of the affiliated societies There is a useful index of authors and subjects

The 1937 issue of the *Municipal Year Book and Encyclopaedia of Local Government Administration* is a large volume of 1,676 pages, and comprises altogether fifty sections Apart from its general utility in many directions it affords a permanent record of the salient events in local government during the past year The Minister of Health again contributes a preface, and the Minister of Transport a foreword to the roads and transport section Fifty pages of the new edition are devoted to a concise survey of the outstanding developments in local government in 1936 There is a comprehensive review of recent local government legislation, followed by a digest of leading law cases of 1936 Statistical tables attached to many of the sections give the latest figures relating to local government services, and these are indispensable for comparative purposes In the directory part of the book the descriptive material concerning local authorities has been revised and brought up to date This well-produced volume, with its handy thumb index, is one of the most complete and satisfactory reference books with which we are acquainted It is published at 30s by the Municipal Journal, Ltd, 3 and 4, Clement s Inn, Strand, London, W C 2

Clio Medica is a series of primers on the history of medicine edited by Dr E A Krumbhaar and published by the firm of Paul B Hoeber, which now forms the medical book department of Harper Bros of New York *Greek Medicine* is the eighteenth volume of the series (price 2 dollars) and has been entrusted to the very capable hands of Dr FRED B LUND of Boston Mass It deals with Greek medicine from Hippocrates to Oribasius, and Dr Lund has wisely fitted himself for the task by rereading in the originals the various writers so far as their works are still available He has thus made an interesting volume for instead of a barren account of sects and methods he tells of the men themselves and what each did to advance knowledge Greek medicine forms the basis of all modern medicine The clear thinking and careful observation of facts often brought the Greek writers very near to modern knowledge of disease Advances in chemistry in physics, and the invention of the compound microscope have in many cases enabled us to demonstrate what they could only surmise Dr Lund points out that as Greek is no longer compulsory in schools the Greek medical writers will not attract much attention in the future But in England and in the United States there are still a number of scholarly physicians and surgeons who will heartily welcome this little volume of 154 pages with seven whole page illustrations

Preparations and Appliances

SOLUSEPTASINE

Soluseptasine—made by Pharmaceutical Specialities (May and Baker) Ltd —is a 5 per cent solution of disodium (γ phenyl propylamino) benzene sulphonamide α, disulphonate The discovery that a group of compounds containing amino benzene-sulphonamide act as effective chemotherapeutic agents in streptococcal infections is one of the most remarkable advances recently made in therapeutics Messrs May and Baker introduced proseptasine (benzyl aminobenzene sulphonamide) for oral use and have now prepared this new compound which is suitable for either intramuscular or intravenous injection It is only recently that the chemotherapeutic action of this group of drugs has been discovered, knowledge of its possibilities and limitations is still imperfect and so also is knowledge regarding the optimum dosage and form of administration Messrs May and Baker state that clinical trials are proceeding with their new compound

A LIVER PREPARATION

' Orheptal ' (E Merck Darmstadt) is a preparation for oral administration which contains concentrated liver extract with salts of iron copper and manganese glycophosphates caffeine quinine tinctures of nux vomica gentian absinthe, and orange peel, together with a few other ingredients

giving no fixation showed any neutralizing antibodies, and in this case only partial neutralization was given by the serum diluted 1 in 2 The explanation might be that other factors are involved in resistance to the virus or that those who were not infected had not been exposed In either event the provisional conclusion that the presence of complement-fixing antibodies indicates some degree of clinical immunity seems justified, as no cases of influenza occurred in those giving a positive reading

Further facts to support this argument are (1) One of us (L H) had a complement fixation titre of 1 in 16 before the epidemic began In spite of the fact that he has been in close and continued contact with infected material and that three cases developed in his household he remained quite unaffected (2) A second person who also had a titre of 1 in 16 before the epidemic began, *was in close contact with three cases of influenza*, apparently infected one from the other during the course of their illness, and remained well throughout

Discussion

Convincing evidence has been obtained that the human type of influenza virus identical with that isolated in other places was the primary aetiological agent in the recent epidemic of influenza in Manchester Not only was the virus isolated from a number of cases but there was also a definite increase in the antibody titre of convalescent sera as demonstrated by complement fixation In a few instances it was possible to examine the serum before and after an attack and in each case an increased titre was recorded

The results also suggest that individuals with a low antibody titre are more susceptible to infection than those with a high titre This may be of some practical value, as recent work indicates that prophylactic vaccination may soon be available for general application Francis and Magill (1937) have been able to produce a decided rise in antibody titre by the subcutaneous injection of living culture virus without causing any signs of infection They suggest that this increase in circulating antibodies is accompanied by an increased ability to combat the natural infection It follows, therefore that if it is possible to differentiate immune from susceptible persons the application of active immunization will be assisted The complement-fixation test is the most satisfactory of the tests at present available for this purpose and is also the most simple to apply By our method a titre of 1 in 16 or over suggests a high degree of immunity while it seems probable that titres of 1 in 4 or 1 in 8 may represent an immunity sufficient to prevent infection in a mild epidemic

Conclusions

1 The human type of influenza virus was the primary aetiological agent in the recent epidemic of influenza in Manchester

2 The influenza virus has been isolated from thirteen cases of epidemic influenza and all strains examined were identified as the human type

3 No evidence was obtained to indicate that any pathogenic organism (in particular *H influenzae*) was involved in the cases examined

4 By means of the complement fixation test a high antibody titre was generally found in convalescent sera

5 This test provides a possible method for differentiating immunes from susceptibles and may prove of value when a satisfactory prophylactic is available

We wish to express our gratitude to the many persons who have assisted in the collection of material

CONTINUOUS OPEN AIR FOR PNEUMONIA IN CHILDREN

BY

H L WALLACE, M B, F R C P Ed

Assistant Physician Royal Edinburgh Hospital for Sick Children Lecturer in Child Life and Health University of Edinburgh

The treatment of acute primary pneumonia in children is a subject which, more especially in the winter months must provoke anxious thought and interest While it is well recognized that alveolar or lobar pneumonia occurring in the older child is in the majority of cases a self limiting illness having a comparatively low mortality it has to be admitted when the disease is considered in all its aspects and in children of all ages that pneumonia still remains one of the commonest and most serious infections of childhood, claiming a vast number of victims each year

The object of this paper is not to enumerate the various forms of therapy that may be employed in the treatment of pneumonia in children, but rather to stress the importance of one particular remedy which by its very simplicity can be almost universally applied Since Claude Ker (1904) advocated the open air treatment of broncho pneumonia complicating measles and whooping cough conceptions regarding the management of patients suffering from this disease have completely changed and the majority of physicians are personally convinced that the era of the hermetically sealed window and the stuffy sick room is rightly gone for ever In spite of this general conviction however, there would still appear to be considerable divergence of opinion as to whether all cases of acute pneumonia should be treated in the open air as a routine measure or whether such a regime should be limited to certain selected types of the disease Furthermore there does not appear to be any universal plan applicable to this form of treatment since it is found that even in the most authoritative works on diseases of children a variety of opinions is expressed and not infrequently there is noted a lack of precision as to what exactly is meant by open air treatment For example is exposure to open air beneficial in all types of acute primary pneumonia in children of all ages or should this plan of therapy be reserved exclusively for cases of bronchopneumonia or only for cases of lobar pneumonia? And if it be decided that the patient would benefit from some form of open air treatment should he be exposed to all the winds that blow or should he though placed in a well ventilated atmosphere, be protected from draught?

During recent years it has been the practice in one of the wards at the Children's Hospital in Edinburgh to submit every case of pneumonia on admission to an intensive open air regime This is carried out irrespective of the season of the year or of weather conditions with the one exception of fog each child being placed on the windward side of the ward beside a widely opened window so that the cold air from without plays directly on the child's face The aim in each case is to ensure that the maximum of cold air blows directly on to the child an

THE EVIDENCE FOR COMPULSORY PASTEURIZATION OF MILK

BY

C FRASER BROCKINGTON, M D

Medical Officer of Health Horsham and Petworth Combined Districts

For many reasons the popularity and consumption of milk are on the increase so that the time has come for the medical profession in general and health authorities in particular to take stock of their position in this matter Milk is the vehicle for carrying many unpalatable things farm dirt cow manure filth from milkers hands dirt from vessels, as well as other things not unpalatable but often disastrous to man such as *Brucella abortus* Koch s tubercle bacillus and the organisms of enteric fever There is a school of thought which believes that we must all swallow a peck of dirt before we die This should be a consolation to the many who are forced to drink milk with admixture of manure in varying strength and until the far off day when all milking will be mechanically performed, with conveyance direct from the cow into sealed sterilized bottles it seems reasonably certain that milk will continue to contain dirt

For this there are two reasons first, that milking cows are most difficult animals to keep clean since they pro duce great quantities of liquid manure, and secondly, that the milker is a poorly paid worker to whom cleansing of udders and washing of hands are irksome matters, generally inadequately performed There can be no ques tion that efforts by sanitary authorities to improve the cleanliness of milk production under the various Orders and Regulations evolved by the Ministry of Health have brought about great improvements and to day the pro duction of milk is very much more cleanly than a decade ago Yet they have done little more than remedy gross abuses the day is far removed when cows will be groomed like horses However, if it is as yet impossible to ensure that the community shall consume milk free from dirt, there can be no convincing argument in favour of continuing to allow this milk to carry live pathogenic organisms Very few will now welcome tuberculous milk for its immunizing properties Vaccination by a method so crude that many succumb to the immunizing dose should find little support in the scientific world of to day where any form of immunization with an equal number of fatalities would instantly be abandoned

Pathogenic Organisms Derived from the Cow

Pathogenic organisms may gain entrance to milk before and after it leaves the cow In the first group are those arising from cattle infections the chief organisms being bovine tubercle bacilli *Brucella abortus* and streptococci from mastitis The incidence of bovine tuberculosis in children as meningitis cervical adenitis and lesions of the bones and joints has been estimated by various workers Dr Stanley Griffith (1934) cultured material from the meninges of 214 cases of tuberculous meningitis In this series combining results from England and Scot land 24 3 per cent proved to be of bovine origin In England the amount is somewhat lower at 21 8 per cent and in Scotland considerably higher at 40 5 per cent Since pasteurization of milk is very much more exten sively employed in towns and cities and the above figures include the excess of infections due to the human bacillus occurring in towns it is probable that the percentage incidence of bovine meningitis in country districts of England is even higher In support of this there are Griffith s thirty-three cases from the county of Kent of which 33 per cent were found to be bovine in origin It is significant also that during the first year of life only 15 per cent were bovine since cows milk is more com monly heated when given to babies than to children of higher ages

The incidence of bovine tuberculosis in cervical glands appears to be greater than that in the meninges In England Griffith (1929) found 45 7 per cent of cases (fifty three out of 116) to be due to the bovine type In Scotland the proportion is even higher, Mitchell (1914) in Edinburgh finding 88 per cent and Blacklock (1932) in Glasgow 64 3 per cent of cases (eighteen out of twenty eight) of bovine origin There is, again a difference between country and town children for Blacklock remarks a striking fact that of the twenty one country children in our series of cases with tuberculous cervical adenitis sixteen (76 2 per cent) were infected with bovine strains and five with human while of the seven city children [Blacklock refers to Glasgow where he says 80 per cent of the milk is pasteurized] only two (28 6 per cent) were infected with the bovine type Finally in lesions of the bones and joints Blacklock (1931) found 34 6 per cent (nine out of twenty six) to be bovine Griffith 20 9 per cent (eighty nine out of 426) in English children and 28 6 per cent (eight out of twenty eight) in Scottish children Roughly then for Great Britain as a whole at all ages half to two thirds of the cases of tuberculous cervical adenitis one quarter of the cases of tuberculous meningitis and one fifth of the cases of bone and joint tuberculosis appear to be of bovine origin

If we now turn to undulant fever we find evidence of extensive infection of humans by *Brucella abortus* derived from milk But owing to the insidious nature of this fever and the difficulty in diagnosis we have not the same wealth of statistics as are available for bovine tuberculosis It is only within the last decade that the possibility of infections of the human with *Brucella abortus* has been largely recognized In 1928 Dalrymple Champneys (1934) records that only five cases were re ported In 1932 with increasing diagnosis this number was fifty seven There is little doubt that the true number of infections is considerably in excess of this possibly even ten times that number (Wilson *1932*) Dalrymple Champneys has collected 147 cases and reports that 141 of these were consumers of raw milk—that is milk which had not been boiled or pasteurized —and he adds It is important to note that two of these patients drank Certified milk three Grade A tuberculin tested and four Grade A He recommends that failing the provision of abortus free herds all medical officers of schools should insist upon a pasteurized supply of milk

There is a similar uncertainty as to the incidence of streptococcal infections resulting from mastitis sores on the teats and other septic infections Such infections are not notifiable and they go for the most part unrecorded In America (Rosenau 1935) between 1907 and 1923 there were seventeen outbreaks of septic sore throat with a total of 3 497 cases Some of these may have been due to contamination of milk after it had left the cow In English outbreaks of which that occurring in Brighton and Hove in 1929 was a classic example the sore throat is of varying grades of severity and the worst cases have a variety of complications possibly with fatal results As another example of many such milk borne outbreaks in England may be quoted that which occurred in August 1935 at Chelmsford when the number of cases of septic sore throat was of the order of 1 600 (Camps and Wood 1936)

The Extent of the Danger

The situation thus revealed as to the incidence in England of these three cattle infections is serious *Brucella abortus* and the haemolytic streptococcus to an extent at present impossible to estimate swell the reser voir of undiagnosed and undiagnosable fevers and the bovine tubercle bacillus causes the deaths of four times as many children as scarlet fever and over half as many as diphtheria The percentage of cattle infected is clearly very high The number infected with tub r culosis has been variously placed at between 30 and 70 per cent It is not clear how many of these are actually excreting tubercle bacilli in the

entirely different procedure from what is usually understood by the somewhat ambiguous advice that 'the child should be nursed in a well-ventilated room adequately protected from draught'. An essential precaution is, of course, that the patient should be warmly clad so as to prevent chilling the face being the only part of the body exposed to the air. All cases of pneumonia are thus treated both day and night until the temperature falls and remains at the normal level. This somewhat rigorous method of treatment has now been thoroughly tested in approximately 300 consecutive cases of pneumonia and the impression formed not only by the physicians attached to the ward but also by the nursing staff, is that exposure to a moving current of cold air in this manner is the means of saving lives in children of all ages suffering from acute primary pneumonia. In this connexion certain of the more striking clinical impressions may be worthy of record.

Clinical Impressions of the Treatment

It must first of all be stated that the treatment of pneumonia in the manner described appears to be free from all danger to the patient concerned, and in this series of cases it has not been possible to attribute to the cold air any ill effect whatsoever. One of the most interesting features is the attitude of the child towards this mode of treatment, since it is frequently observed that interruption of the flow of cold air by closure of the window tends to make the child fretful and restless, and that when the window is reopened he will almost immediately subside into a peaceful sleep. This impression is very striking, and has been frequently noted, and it is a significant fact that sedative drugs are but rarely required to induce sleep or to allay restlessness. Another important feature is the effect of the open air on the child's appetite; it is exceptional to experience any difficulty in persuading the patient to take nourishment if treated in this manner. Apart from small doses of brandy, stimulants are hardly ever required except in the most desperate cases, and the administration of oxygen, either with or without carbon dioxide, has been almost entirely abandoned as irrelevant. Thus cold air appears to bring comfort to the patient, aids his appetite, and helps to render unnecessary other forms of treatment which may prove exhausting to a young child suffering from an acute illness.

Control Cases

When an attempt is made to assess the efficacy of any special method of treatment it has to be realized that clinical impressions are not sufficient, and one of the most difficult obstacles to overcome is that of obtaining suitable control cases for the purpose of comparison. This difficulty is very apparent in a disease such as pneumonia, which probably varies both in severity and in type from year to year, and it would therefore be of little value to judge the effect of any therapeutic measure by comparing the mortality rate at the present time with that during previous years. In this investigation into the value of open air treatment in pneumonia there is fortunately what may be regarded as an almost ideal series of control cases, inasmuch as the latter are consecutive cases of pneumonia admitted to one of the other wards of the Children's Hospital during exactly the same period.

This control group comprises 275 cases treated according to a somewhat different scheme. In this group those patients admitted during the cold winter months were not as a rule subjected to an open-air regime, but were treated by such measures as the continuous administration of oxygen, the exhibition of powerful stimulants, and the inhalation of air moistened by steam. The comparatively small minority admitted during the warmer months were in many instances placed adjacent to an open window, but always on the sheltered aspect of the ward and only when the weather was clement. Furthermore open air was not favoured at any season of the year for the children in this group who were under 2 years of age. Thus there are two groups of cases. Group A, in which all cases were placed in the open air continuously and indiscriminately at all seasons of the year, and Group B consisting of cases treated either by fresh air to a modified degree in the milder weather, or more frequently by various other forms of active therapy. It should be clearly understood that the difference in the management of these two groups of children is not merely one of degree, since in the control series an open air regime was not employed as a routine measure, and in those cases where such a regime was adopted it was not carried out nearly so intensively as in Group A.

Comparative Mortality Figures

For the purpose of this survey the cases have not been classified according to bacteriological or pathological type, since there is as yet no uniformity of opinion as to the criteria which distinguish bronchopneumonia from alveolar pneumonia in very young children. Doubtless the view will still be confidently expressed by some that the vast majority of children under 2 years of age were suffering from bronchopneumonia. For this reason it was considered that a more accurate and a more intelligible comparison of the two groups could be made by dividing the cases in each group into various age periods rather than making a somewhat arbitrary attempt to differentiate pathological types. It is probably true also that the mortality rate in acute primary pneumonia is governed to a large extent by the child's age at the time of the illness, and a comparison of similar age groups in the two series will therefore afford reliable evidence. In consideration of the fact that this investigation is concerned entirely with treatment all cases in which the patient died within forty-eight hours of admission to hospital have been omitted from both groups, since it is probable that such cases were frequently beyond the scope of any form of treatment. Apart from this no selection whatever has been made in either group, and it is felt therefore, that the two series are reasonably comparable.

Tables I and II show the number of deaths and the mortality per cent in the two groups of cases, Group A representing those cases treated by the intensive open air plan and Group B comprising the control cases. Owing to the very high mortality from pneumonia in infants as compared with older children the cases in each group have been divided into two large age periods.

TABLE I.—*Mortality Rate in Group A*

	Cases	Deaths	Per Cent
Under 2 years	134	30	22·4
Over 2 years	158	4	2·5
Totals	292	34	11·6

TABLE II.—*Mortality Rate in Group B (Controls)*

	Cases	Deaths	Per Cent
Under 2 years	136	51	37·5
Over 2 years	139	8	5·8
Totals	275	59	21·5

faeces which subsequently contaminates the milk, but in Manchester in 1929 9·8 per cent of milk samples were found to contain virulent bacilli and of samples from 697 farms sending milk into Manchester eighty-eight (12·63 per cent.) gave positive results (Ministry of Health Report 1931). Dalrymple-Champneys (1934) has said that experienced veterinarians are agreed that something like 80 per cent. of our milk herds are infected with *Brucella abortus* and that most if not all infected cows excrete this organism in their milk at some time during their infection which is usually long. The incidence of mastitis is extremely high and affects even the herds producing graded milk. For example Pullinger (1935) found that milk from ten out of twelve herds producing certified milk and twelve out of fourteen herds producing Grade A tuberculin-tested milk contained mastitis streptococci when examined at intervals over a period of fifteen months. In short it would probably be no exaggeration to say that three-quarters of the cattle in England would at any one time be found to be excreting one, two or even three of these organisms in virulent form.

The removal of such extensive infection seems almost hopeless. Even with a State veterinary service a carefully organized eradication campaign control of important and internal markets and almost unlimited funds any substantial progress would take long years to achieve. In the meantime tuberculosis alone among the numerous milk borne diseases would probably cause about 2,600 deaths annually (Economic Advisory Council Report, 1934). Compare this with the dramatic results achieved in Toronto where following the institution of universal pasteurization in 1915 no single case of bovine tuberculosis among city children has occurred (Price, 1934).

Pathogenic Organisms Not Derived from the Cow

In the second group of pathogenic organisms contaminating milk are those which may gain entrance to milk *after* it has left the cow: these are usually of human origin. The opportunities for contamination of milk are abundant—at the time of milking in the dairy during transportation or in the household—and milk may, in addition be contaminated by flies. There is no doubt that in this way a great number of epidemics of enteric, cholera, dysentery, scarlet fever, diphtheria, and septic sore throat have occurred. Rosenau (1935) reports that in the United States between 1907 and 1923 there occurred seventy eight outbreaks of typhoid fever with a total of 3,008 cases, fifteen outbreaks of scarlet fever with a total of 2,940 cases, seventeen outbreaks of septic sore throat (these were probably mainly the result of mastitis not of contamination from outside) with a total of 3,497 cases, and seven outbreaks of diphtheria with a total of 169 cases. Rosenau adds that since the general adoption of pasteurization for milk supplies of large cities in Massachusetts milk borne outbreaks occur characteristically in small unpasteurized supplies. When all these facts are brought together he continues they make a strong indictment against raw milk. Indeed there is such a wealth of data recording outbreaks of milk-borne disease due solely to the contamination of milk after it has left the cow that the very weight of evidence serves to confuse and to suggest that that which has existed so long might be allowed to continue unchecked. If more eloquent testimony were needed than that already provided by the long list of milk-borne epidemics which have been placed on record it is to be hoped that the recent outbreak of typhoid in Bournemouth which for severity recalls that in Clifton in 1897 (Davies) and which was checked by pasteurization will have served to bring the risk and the realization of the remedy clearly before the public.

There can indeed no longer be any doubt that the time for more active prevention than that yet exercised has arrived. Bovine tuberculosis is a deadly malady with a terrible tragedy to parent and child undulant fever is an insidious disease often baffling to the doctor and the cause of long periods of ill-health typhoid and other milk-borne epidemics are the more disastrous because of their suddenness and the difficulty of tracing their origin. Against all this there is a preventive as complete and absolute as is vaccination against small pox or inoculation against diphtheria. If all milk from to-day were pasteurized there need not be one more child crippled by bovine tuberculosis. Hospital mortuaries in England would be depleted of a third and those in Scotland of nearly one half their present number of victims of tuberculous meningitis epidemics of milk-borne diseases would cease and finally, many persons would be saved from the debilitating effects of undulant fever. It has been said and many would agree that 'there are only two grades of milk—raw and pasteurized raw milk has yet to be shown fit for human consumption.'

Summary

1 Milk purveyed by present methods may contain dirt and pathogenic organisms.

2 Dirt may be tolerated but pathogenic organisms should be permitted no longer.

3 Cattle infections contaminating milk while in the udder and a variety of organisms introduced to milk later by human handling are to-day causing sickness the amount of this has not yet been completely estimated but it has been shown clearly by many workers to be extensive.

4 The eradication of these infections among human beings cannot be left to await a Utopian state where diseased cattle have been eliminated and all milking is mechanically performed in such a manner that external contamination is no longer possible.

5 Universal compulsory pasteurization presents the only method of preventing the spread of cattle infections and the contamination of milk by human handling.

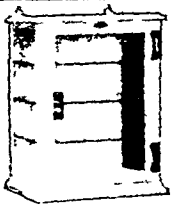
H. W. Willis (*J. Pediat.*, January 1937, p. 65) who records an illustrative case states that the majority of cases of nicotine poisoning on record are in adults. Of seventy four fatal cases collected by Franke and Thomas (*J. Pharmacol. and exper. Ther.*, 1933) twenty eight were from concentrated solutions of nicotine and forty six from tobacco poisoning. Although only a few cases have been reported in children, their frequent exposure to tobacco makes it a clinical entity with which every physician should be familiar. The possibility of acute nicotine poisoning should always be considered in cases of coma of unknown cause. Treatment consists in artificial respiration and injection of adrenaline into the left ventricle. Willis's patient was a boy aged 5, who became unconscious and vomited continually immediately after an enema consisting of 60 c.cm. of strong tobacco juice in 1,000 c.cm. of water which was given for threadworms. Recovery took place after three doses of sodium benzoate and copious enemas to eliminate the nicotine.

SAFEGUARD!

against droplet infection by Haemolytic Streptococci

Designed by eminent medical authorities after untiring research in connection with the dangers of droplet infection the Cestra Mask offers completely reliable protection. Made of a quadruple thickness of fine dental gauze it completely arrests all droplets emanating from the nose and throat. Fastened securely under the chin with an air seal at the side it is extremely comfortable to wear for long periods. It is easily sterilized



Specially designed for use during Obstetrical Practice BACTERIOLOGICALLY TESTED

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS
NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C M G A D C

Medical Superintendent DANIEL F RAMBAUT M A, M D

This registered Hospital is situated in 120 acres of park and pleasure grounds Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble temporary patients and certified patients of both sexes are received for treatment Careful clinical biochemical bacteriological and pathological examinations Private rooms with special nurses male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders It contains special departments for hydrotherapy by various methods including Turkish and Russian baths the prolonged immersion bath Vichy Douche Scotch Douche Electrical bath Plombières treatment etc There is an Operating Theatre a Dental Surgery an X ray room an Ultra violet Apparatus and a Department for Diathermy and High Frequency treatment It also contains Laboratories for biochemical, bacteriological and pathological research

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres Milk meat fruit and vegetables are supplied to the Hospital from the farm gardens, and orchards of Moulton Park Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming gardening and fruit growing

BRYN-Y-NEUADD HALL

The seaside house of St Andrew's Hospital is beautifully situated in a Park of 330 acres Llanfairfechan, amidst the finest scenery in North Wales On the North West side of the Estate a mile of sea coast forms the boundary Patients may visit this branch for a short seaside change or for longer periods The Hospital has its own private bathing house on the seashore There is trout fishing in the parl

At all the branches of the Hospital there are cricket grounds football and hockey grounds lawn tennis courts (grass and hard courts) croquet grounds golf courses and bowling greens Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry etc

For terms and further particulars apply to the Medical Superintendent (Telephone No 2356 and 2357 Northampton) who can be seen in London by appointment

COURT HALL, KENTON, near EXETER,
for the treatment of eight Ladies, voluntary, temporary or certified patients

THE CONTROL OF LEPROSY

It is calculated that there are at least five million sufferers from leprosy in the world This figure is not based on accurate statistics, as in many of the countries in which it is most common vital statistics are not available Even in India, where lepers are enumerated in the decennial census special "sample surveys" made by expert doctors in limited areas showed that the 1921 census figures had to be multiplied five to fifteen times to give anything like a correct estimate of the incidence of the disease

Leprosy appears to have been common in England at one time old records dating from a period when the population was between two and four millions show the existence of over 300 lazarets Doubtless many of the inmates of these institutions were not real lepers, but suffered from syphilis and various disfiguring cutaneous diseases Still there seems little doubt that leprosy was once an extremely common disease, both in this country and throughout Europe, during the Middle Ages The lazaret was primarily an almshouse erected by charitably disposed patrons for the shelter of these unfortunate people But about the beginning of the fourteenth century people became aware of the contagious nature of leprosy and the leper was banished from the community The funeral service was read over the unfortunate victim, who was thereafter counted as dead to the world and strictly forbidden to mix with his fellows Many of these poor people were sheltered in lazarets others wandered about the country making a precarious livelihood by begging It is probable that the chief reason for the disappearance of leprosy as an endemic disease was this recognition of contagiousness and the simple though somewhat barbarous means that were taken to prevent the spread of contagion Similar, though more humane measures have been responsible in more recent years for the control of leprosy in European countries like Norway and Iceland

Though there are still upwards of one hundred leprous subjects in England—people who have contracted the disease in the course of their work in the Tropics—leprosy is no longer considered a menace in this country and is not even a notifiable disease Its power to spread from the infected to the healthy is of a low order, considerably lower for instance, than that of the sister disease—tuberculosis—which is still notifiable Why, then does leprosy persist in lands like China, India and Africa when it has ceased to be a menace in most of the countries of Europe and North America? There seems little doubt that it belongs to a certain stage of sanitation and human development Among wild, free living, nomadic tribes leprosy is seldom found Under moderately sanitary conditions it fails to spread It is in the congested and filthy surroundings of family or communal life so common in the Tropics and subtropics that the requirements for contagion are found This is further helped by parasitic and especially cutaneous disorders which facilitate the entrance of infection Not less important is the debilitating effect of various other diseases and poor nutrition so prevalent in backward countries these predispose to leprosy It may be objected that sanitation even in England leaves much to be desired at least in depressed or slum areas why then is leprosy seldom spread by the uncontrolled lepers at present in this country? The latter are almost always men and women who take necessary precautions to avoid contact with others and they are seldom people who come in close contact with young children Recent investigations tend to show that it is the infection of young children that is chiefly responsible for the persistence of leprosy in a community Healthy adults seldom acquire the disease, or if they do it is generally a mild uninfectious form which tends to die out

In the control of leprosy compulsory segregation enforced from without the community has generally been found ineffective It tends to produce concealment, and thus fails in its object It is a different matter when pressure is brought to bear from within the community as it was in England in the fourteenth century If the community knows the danger and its source, knows that its children are in danger if they come in contact with the leper knows that effective segregation is the only means of averting that danger then it is likely to see that the necessary means are taken to avert that danger The means taken to deal with leprosy will vary in different countries and districts but whatever methods are used they must centre round an educative programme In India and Africa the almshouse and lazaret are being replaced by the agricultural and industrial settlement with occupational therapy, which renders the patient hopeful and happy This is an excellent step in the right direction But these settlements though economically run and to a large extent self supporting still

INSURANCE MEDICAL SERVICE WEEK BY WEEK

The New Edition of "Medical Insurance Practice"

There is no doubt as to the success which has attended the issue of the new edition of *Medical Insurance Practice*. The whole supply of 5 000 copies has already been sold and a further 5 000 copies are on order. The attention of the authors has been drawn to one or two minor statements needing amendment and they are reproduced here for the information of those practitioners who have already become possessed of the book.

Change of Practitioner

A drafting amendment has been introduced in Clause 4 (1) of the Terms of Service to reconcile a difference between that subclause which gives insured persons one month from the date of issue of notice within which to signify their desire not to be transferred to the doctor succeeding to the practice of one who has died or withdrawn from the *Medical List* and Regulation 16 (3) which refers to a period of one month from the date of *receipt* of the notice, the requirement being effected by the substitution of the word receipt for the word issue in the tenth line of clause 4 (1). The necessary correction is being made on page 264 of the book.

Fees under the Road Traffic Act

The position under the Road Traffic Act where an insured person has been treated is properly stated at page 152 of the book, but the following amendment of the model distribution scheme which has been approved by the Ministry with effect from January 1 1937 is being added on page 292 at the end of Clause 3:

"Provided that no fee shall be payable under this clause where a practitioner is entitled to receive a fee under Section 16 of the Road Traffic Act 1934 unless the Panel Committee is satisfied that the practitioner is unable for any reason other than his own default to recover such last mentioned fee."

Transfer of Patients to Another Doctor

The restrictions on the right of a practitioner to give notice of his desire to have an insured person removed from his list are correctly set out on page 23 of *Medical Insurance Practice* as follows:

"The allocation scheme for your district will probably contain some restrictive provision to meet cases where owing to his condition of health the insured person would suffer hardship by being removed from your list at short notice. Most schemes provide that where the insured person is incapable of work at the date when the removal would ordinarily take effect you must notify the committee of the incapacity. The change of doctor will then be postponed until fourteen days after the date when the patient is declared fit to resume work. This restriction will not however ordinarily apply in cases of chronic illness where treatment is being given at less frequent intervals than one week."

The model allocation scheme at *the top of page 289* contains an earlier provision which reads as follows:

"This paragraph shall not apply in any case in which owing to the chronic nature of the insured person's illness medical certificates are under the terms of the Medical Certification Rules being given at less frequent intervals than one week." The present allocation scheme reads however as follows: "This paragraph shall not apply in any case in which owing to the chronic nature of the insured person's illness treatment is being given at less frequent intervals than one week." The necessary correction is being made in the book.

With regard to the question of the transfer of a patient from one doctor to another a correspondent who thinks that the book should be of immense value to the practitioner, but desires to suspend judgement until he has studied it more carefully, is rather critical because there is no definition of the word 'district' in the following paragraph on page 24:

"The insured person may at any time apply to another doctor for acceptance without giving any reason for his wish to transfer. If he is accepted the new doctor thereupon becomes responsible for his treatment. But if he is still in the first doctor's district he cannot be immediately placed on another doctor's list unless both doctors signify their consent to the transfer in writing on the medical card to be sent by the new doctor to the insurance committee."

The answer to this criticism is that a doctor's district is that within which he has undertaken to visit insured persons as set out in his original notification to the Insurance Committee of his intention to undertake insurance practice. A copy of this form of notice is printed on page 3 of *Medical Insurance Practice*.

The Insurance Practitioners' "District"

As the practitioner referred to in the preceding paragraph may not be alone in his uncertainty with regard to his 'district' it may be as well to amplify what has been said on this question. A district may and does vary as between the different insurance committee areas. In a small town or country area the doctor's practice will often correspond with the whole area and no difficulty is likely to arise. In London and the large towns there is usually some clear definition which is well understood by all the practitioners concerned. In London the word district is defined as covering two miles by road from and on the same side of the River Thames as the doctor's residence or surgery, subject to the requirement that the doctor must visit a patient at the place at which he resided when he was accepted by the doctor even if that place is beyond the two miles limit. (There is no restriction in London as to the distance within or within which a doctor may accept a patient.) An easy approach to the question is as follows: Mr A an insured person who is on the list of a doctor applies to another doctor for acceptance. If it is beyond doubt that he has changed his address to one which is more than two miles from the residence or surgery of the doctor named on the front of his medical card then the new doctor may accept him. But he may not do so if he is still within that distance. It is true that a doctor cannot be expected to be an expert on local topography but the London Insurance Committee has a map measuring device and a ring on the telephone will generally settle a doubt.

Persons Over 65 Years of Age

Another question which has been asked in connexion with the removal of patients from a doctor's list is: Why is there no special reference on page 23 of *Medical Insurance Practice* to the case of a person over 65 years of age? The answer is that there is no occasion for a special reference as a doctor may request the insurance committee to remove from his list a person over 65 years of age in the same way as he may ask for an insured person less than that age to be removed. He cannot in any case have an insured person removed from his list if at the date when the removal would take effect the insured person is incapable of work and is receiving treatment from the practitioner. *This restriction* however as already noted above does not apply in any *case in which* owing to the chronic nature of the insured person's illness treatment is being given at less frequent intervals than one week.

cost much money and reach only a very small fraction of those suffering from leprosy The leper settlement can however be used as a centre for education and enlightenment The patients themselves can be trained so that when they recover and return to their villages they may help to spread knowledge regarding the nature of leprosy and the simple measures needed to prevent its dissemination We are told that in England in the Middle Ages lepers congregated in brothels and sought to disseminate infection Hopeless themselves of recovery they bore a grudge against those who had outcast them and they thus sought to add to their numbers The modern educational settlement seeks to reverse the process It gives hope to the victim and sends him out on recovery to spread the gospel of hope and prevention

The final control and eradication of leprosy must necessarily wait till the sanitary education and general amelioration of the people of backward communities is accomplished But leprosy can be used as a lever in raising the standard of living and hygiene In England the lazaret and almshouse was the prototype of our modern hospital The preventive measures centring in the funeral mass and separating the leper from his fellows was the earliest dawn of our present sanitary system Leprosy is not a fatal disease It is dreaded not because it kills like tuberculosis cancer and cholera but because it condemns its victim to long years of living death This dread can be used as a powerful impulse in the campaign for clearing up not only leprosy but also the other diseases, insanitary conditions and dietary deficiencies which predispose to leprosy

The British Empire Leprosy Relief Association is seeking to work along the lines sketched above During the thirteen years since its inception it has taken a leading place in the clinical pathological, and bacteriological investigation of the disease, and has made extensive epidemiological surveys in India Africa and other parts of the British Empire It seeks to advise Governments missionary societies, and philanthropic bodies regarding the many problems connected with leprosy and the best methods for its control Within the last few years it has sent out doctors and medical assistants to Africa and India Leprosy though so important a disease in the Tropics is but imperfectly understood in England and the association seeks through lectures and by means of its quarterly publications *The Leprosy Review* and *Leprosy in India* and other literature to interest and inform the medical profession as well as the lay public regarding the disease and to enlist their support in the anti-leprosy campaign

GASTROSCOPY

Since cystoscopy and sigmoidoscopy furnish information which cannot be obtained by other means at our disposal and are in consequence practised daily, it might be expected that an endoscopic examination of the stomach would be an equally valuable procedure, and in time become as widespread and as relatively common in practice Exploratory laparotomy for suspected gastric disease is still carried out in certain cases in which, despite recent improvements in radiology and careful clinico-pathological investigations it has not been possible to make a diagnosis, but even when the stomach is exposed at operation there may be little or no evidence as to the condition of its mucosa Rovsing's gastroscope or a substitute for it in the shape of a single catheterizing cystoscope introduced through a small opening into the air-filled stomach carries such an investigation a stage further, but its use necessitates gastrotomy as well as laparotomy For many years attempts have been made to examine the stomach by means of an illuminated tube passed down the oesophagus The first experiments were conducted nearly seventy years ago at a time when the electric incandescent lamp was unknown, but although with the arrival of the Edison-Swan vacuum lamp great advances were made in all forms of endoscopy there was some delay in utilizing to the full this method of exploration of the stomach lining The procedure was technically difficult and dangerous and the view afforded of the interior of the stomach limited and unsatisfactory but with the introduction of the Wolf-Schindler gastroscope which is a semi-flexible instrument, most of the disadvantages were overcome

Schindler and his collaborators[1] in Chicago have now examined more than 2 500 patients gastroscopically and have observed some of them over a number of years one patient having been gastroscoped sixty-five times Many other workers have been investigating the possibilities of gastroscopy H W Rodgers[2] at St Bartholomew's Hospital has introduced a useful modification of the Wolf Schindler instrument in the shape of a distensible rubber bag placed near the examination lens, so that when the observer introduces air into the bag the tip of the instrument with the examining lens is lifted away from the folds of the gastric mucous membrane and their inspection facilitated In this country also studies have been made among others by H C Edwards at King's College Hospital, R S Aitken in Professor Fraser's clinic at the

HOSPITAL POLICY

The usual meeting of the Hospitals Committee of the Association on March 10, with Dr PETER MACDONALD presiding, had a variety of important matters to consider Always at these meetings local disputes concerning the staff of a particular hospital or group of hospitals, or difficulties with regard to remuneration and status come forward It is not always expedient to publish them, and if published they would often be too detailed to be of interest, but some of the most valuable work of the Committee is done, if not by stealth, along these private advisory lines

Junior Resident Medical Officers

One matter of general interest which came forward in a final form concerned the principles which have been laid down for the guidance of hospitals in the appointment and employment of junior resident medical officers A great deal of thought and care has been expended on the report on this subject, which has been approved by the Council, and the question arose as to the means which should be taken to get these principles as widely adopted as possible The conditions of work of resident medical officers vary so greatly—for example, as between large hospitals with several residents small hospitals with one or few, and special hospitals with particular functions—that it seemed that no advantage would be served by formulating detailed model rules applicable to all The Committee decided that publicity should be given to the statement of principles in the expectation that they might be a help to hospitals in formulating or revising their rules The statement will be available as a body of reference when any question as to this class of officer arises at headquarters or elsewhere

The first point laid down was that resident medical officers should be possessed of such qualifications as the committee of management might determine, and should devote their whole time to the service of the hospital Their duties would include the admission and discharge of in-patients in accordance with the wishes of the responsible medical officer this term meaning in voluntary hospitals, a member of the honorary staff, and in council hospitals the medical superintendent or one of his deputies They may be required to give lectures to nurses and to examine and treat nurses and servants reporting to the responsible medical officer in serious cases They would also be required to notify as soon as possible the responsible medical officer of the admission of urgent and important cases and of any serious change in the condition of any case It would be incumbent on them not to permit any patient or any papers concerning a patient to be examined by anyone without the sanction of the responsible medical officer and without such sanction and the consent of the patient they should not furnish any information respecting the case They should also be instructed as to the limitation of admission of visitors

The question of the off duty time of these junior officers has had attention It is felt that such off-duty time must be a matter of arrangement with their colleagues and of agreement with the responsible medical officer Generally speaking they should be permitted to be absent from the hospital for short periods when their daily routine work is done, but without the sanction of the responsible medical officer they should not be absent for long periods, such as a whole day or night Not more than half the resident staff should be absent from the hospital at the same time, and the officers should be required to arrange with their colleagues for the purpose of their duties during their absence In addition to these short periods of absence they should have definitely prescribed periods off duty—for example, two half-days a week, alternate Sundays after 11 a.m., and two weeks' holiday for every six months' completed service

A point which led to a good deal of discussion when this statement of principles was being prepared was the responsibility of resident officers for giving certificates and medical reports, especially their entitlement or otherwise to retain fees It was felt that these matters should be clearly defined in the hospital rules Resident medical officers should be permitted to issue certificates and reports required for legal purposes under the general authority only of a responsible medical officer, and copies of all such certificates and reports should be retained in the hospital records It was mentioned that it is customary in hospitals, especially voluntary hospitals, for resident medical officers holding short-term appointments to be allowed to retain fees for such certificates and reports and for evidence given in a court of law

The case of hospitals with only one resident medical officer also engaged attention Here it was felt to be of urgent importance that the committee of management should arrange with a non-resident medical officer to be on short call for the purpose of urgent duties in the absence of the resident Another principle laid down was that resident officers as a condition of their appointment, should be or become members of one of the medical defence societies also that their appointment should be for a specified period, with the possibility of renewal, and determinable by reasonable notice on either side

Remuneration and Status of Radiologists

Several matters relating to radiologists were on the agenda of the Committee, and Dr Duncan White, as representing the Radiologists Group Committee of the Association attended and spoke to a resolution of that committee that in a voluntary hospital, where there is an honorary director of the radiotherapeutic department private cases should be attended by the honorary staff and not by the whole-time staff, and that if a radiologist was responsible in a voluntary hospital for the type of case which he might reasonably expect to receive as private work he should receive adequate fees for such work Dr Duncan White referred to the increasing employment of subordinate whole time radiological assistants in x-ray departments of voluntary hospitals where the senior medical officers were members of the honorary staff His Group Committee felt that in voluntary hospitals where there was an honorary director of the radiological department the private cases should be referred to him The patients who went into the pay blocks were of the class of the community who in the ordinary way would be examined in the private practice of the honorary member of the staff, but in fact they were drafted to the hospital whole-time staff, who were salaried persons, and the hospital received the fees Dr Duncan White said that his Group desired him to put forward two propositions, one being that the responsibility for radiological work in the private wards should be that of the honorary radiologist in which case he should receive a certain proportion of the fees paid, the remainder going to the hospital, and the other, that where he did not carry out the whole of the work himself an appropriate division of the fee should be made

Dr Duncan White also dealt with a question raised by the Group Committee concerning the status of the radiologist at voluntary hospitals His committee was of opinion that the principle that in all hospitals the honorary staff should constitute a medical board to which all matters affecting any of the staff were to be referred was rightly applicable to radiologists in common with other members of the staff He gave instances in which this was not the case

With regard to the last point, the Chairman remarked that the wisest course might be to inform the office of any specific hospital in which an anomaly of the kind had occurred so that it could be dealt with from headquarters

British Post Graduate Medical School and Hermon Taylor who working as a Moynihan Fellow of the Association of Surgeons in Sir James Walton's clinic at the London Hospital, has recently reported his experiences [3 4] These have shown that it is possible to detect gastric ulcers which are not demonstrated radiographically and to recognize certain doubtful cases as either malignant or benign Perhaps one of the most interesting observations that have been made with the aid of the gastroscope is that gastritis is far commoner than has hitherto been supposed, and in the diagnosis of this gastroscopy is far superior to radiology Erosions and atrophy of the gastric mucosa can for all practical purposes be diagnosed only by gastroscopy Rene Chevallier of Lyons[6] has found this method of investigation of value in the study of obscure cases of gastric haemorrhage There can be no doubt that with the help of this new instrument of precision we shall be on the way to the solution of many problems relating to disorders of the stomach Technical details are being mastered, the instruments in use improved, and the indications and contraindications better understood We suggest that the time will soon be opportune for a combined discussion by physicians and surgeons with experience of this valuable diagnostic measure so that its limitations and indications may be clearly established Although it does not seem probable that gastroscopy will rival or replace radiology in the diagnosis of diseases of the stomach it is obviously a more direct method of examination and should therefore yield more positive, if more limited information, finally anything that may obviate an exploratory laparotomy is to be welcomed

RESEARCHES ON INFLUENZA

Now that another widespread epidemic of influenza is just over we may ask ourselves how far this visitation has advanced our knowledge of the disease In one direction it has certainly served a useful purpose the primary aetiology of the disease is now finally settled Whatever may have been the significance of earlier work with filter passing agents the discovery by Andrewes Laidlaw and Wilson Smith that a virus recoverable from human cases could be transmitted to and maintained in the ferret has made it possible to compare the findings in epidemics not only in different countries but in different years and among the facts recorded by Hoyle and Fairbrother in their paper in our present issue is the identity of strains of virus isolated in Manchester during this winter with the strain which has now been maintained for three years by the Medical Research Council workers at Hampstead This is not to say that every case of clinical influenza is due to the virus there have been many fruitless attempts to recover it during the past three years from cases meriting the diagnosis and it must be conceded that the syndrome or something very closely approaching it may arise from other causes But as the cause of wide spread epidemics this virus now stands fully accepted Among items in the chain of proof is the case of accidental transmission back from ferret to man which is now put on record in the annual report of the Medical Research Council attributed to the sneeze of an infected ferret this attack was fully studied from the serological standpoint and there are other good reasons for regarding this as its true origin Among new methods of study is the demonstration of antibodies in the blood of recovered cases and other immune individuals either by animal protection tests or otherwise Hoyle and Fairbrother have succeeded in adapting the complement fixation test to this purpose and so found a means of determining the amount of antibody present with some degree of precision they have also been able to relate this amount roughly to degrees of resistance to infection and suggest that such a test may be useful in deciding whether artificial immunization is desirable in any individual case The prospects in this direction are of more interest henceforward than any other aspect of the matter and here progress in the clinical field is bound to be slow, since the opportunities of practical test are short and busy periods recurring at long intervals Active immunization with living virus given by subcutaneous injection has been attempted in the United States and in this country a limited number of people have been treated with formalinized virus with it is understood inconclusive results It is too much to hope that the methods at present available will provide any generally applicable form of prophylaxis nor does it seem likely that immunity thus obtained will be of long duration At the most a further epidemic such as may be expected in a few years' time will enable these proceedings to be tested on a larger scale

AMMONIA FORMATION IN THE LUNGS

Many organs in the body are capable of deaminizing amino acids with the consequent liberation of ammonia and a fatty acid The liver is specially important in this respect and here the resulting ammonia is entirely converted into urea according to Krebs the ammonia unites with carbon dioxide and ornithine to form arginine which is then broken down by the enzyme arginase into ornithine and urea The ammonia formed in the kidney is believed to be secreted by the renal tubules into the blood in amounts which depend on its hydrogen ion concentration The resulting ammonium salts are subsequently excreted in the urine and this mechanism is of considerable importance in preserving the reaction of the blood within narrow limits There is evidence also that during muscular contraction adenyl pyrophosphate (one of the complex organic phosphates found in muscle) is broken down and ammonia is one of the products of its disintegration It has been also suggested that ammonia is formed

Other Hospital Business

Correspondence was reported with the Merseyside Hospitals Council whose secretary Mr Lamb had expressed the hope that in the near future discussion might take place between the British Medical Association and other interested bodies to decide how national policy in the fields of service of the organizations concerned with hospital administration could be harmonized in the interests of the cottage hospital The Chairman said that he would welcome such discussions but on general lines, not restricted to the cottage hospital

Discussion took place on a question raised by the Hospital Savings Association in favour of the extension of the area of the London Consultants List Various opinions were expressed as to what the area might reasonably be held to include There are in fact several metropolitan areas, the county council area being the smallest and the metropolitan police district perhaps the largest This area proved extremely difficult to define but eventually it was agreed to suggest as the metropolitan area for the purpose named the metropolitan police area plus the addition of any part of the territory covered by the King Edward's Hospital Fund which extended outside that boundary

The Chairman reported on the Conference of Provident Associations which had been held the previous week (*Supplement* March 13, p 129) He also stated that on the question of provident schemes and payments to general practitioners for treatment of subscribers to those schemes the joint subcommittee which had been appointed had not been able to proceed very far as yet and he doubted whether it would be possible to produce anything concrete for the next Annual Representative Meeting The insurance companies had been unwilling to touch any form of insurance against general practitioner risks but further cross table conversations were proposed

A question was raised from a hospital concerning the medical and surgical treatment of the hospital nursing staff by members of the medical staff The idea was that nurses should be able to choose their own surgeon and anaesthetist when it was necessary for them to undergo an operation So far as the Committee was aware nurses have been granted freedom of choice as between members of the staff in their own hospitals It was suggested that the local branch of the College of Nursing should discuss the matter with the hospital which had raised the question

INDUSTRIAL ACCIDENTS

The quarterly meeting of the Association of Industrial Medical Officers was held in the London School of Hygiene on March 12 under the chairmanship of Dr LEONARD P LOCKHART

A discussion on accident proneness was opened by Mr ERIC FARMER M A reader in industrial psychology Cambridge University who briefly summarized the investigations which he and other workers had carried out on accident proneness and put forward certain suggestions for future co operative work between the Industrial Health Research Board and industry if practicable through the industrial medical officer

Dr F H C BEARDS (Imperial Chemical Industries Billingham) read a paper on the organized treatment and rehabilitation of the injured workman The progress of the patient from the time of injury to the time of resuming work was outlined and the difficulties of the present procedure in rehabilitation with suggestions for improvement were discussed Dr Beards divided all accidents into minor and major cases although he showed that in importance they were both equal Within the factory certain measures for treatment were essential and the relation of first aid to industry the importance of adequate equipment in the works ambulance rooms and the significance of treatment for shock were stressed A plea was put forward for the provision of alternative work schemes in industry, this could best be done, Dr Beards pointed out by the co operative effort of the industrial medical officer and the works management concerned although primarily it was the duty of the labour management Notwithstanding the fact that only the larger firms could afford to employ whole time or part time medical officers he felt that much more work could be done to help the smaller concerns and that what he had said regarding the large firm could apply in principle equally well to the small firm

TESTIMONIAL TO DR GUY DAIN

The objects of the Fund are to honour Dr Dain for his valuable services to the medical profession during the past twenty years and to give effect to Dr Dain's wish that the amount subscribed shall be utilized for the purpose of assisting the education of sons and daughters of medical practitioners who are in need of such help

PROFESSIONAL SECRECY EXAMINATION AND CONSENT

SIR—With regard to the above matter referred to in the *Supplement* of February 13 would you kindly advise me on the following points in connexion with the examination of prisoners at the request of the police or magistrates for alleged mental deficiency

(*a*) Is there any definite legal ruling that the prisoner should be asked to give his consent and should this be verbal or written? Must the prisoner be told of the reason for the examination?

(*b*) What would be the position of a medical practitioner making such mental examination without asking for the consent or explaining its import?

Would it be possible for you to guide me as to the legal references covering this point?—I am etc

X Y Z

** Our Medico legal Correspondent writes

The ordinary principle of law is that a prisoner must not until he is sentenced to imprisonment be examined without his consent Written consent is safer but verbal consent is sufficient though a doctor would be wise to have it given in the presence of witnesses *The prisoner must be told frankly* why the examination is being performed and the use which may

in nerve fibres when activity is taking place A recent paper by Binet and Bargetson[1] shows that the lungs may also possess the power of forming ammonia from various nitrogenous constituents of the blood and from added polypeptides and amino-acids These workers perfused isolated lungs with blood for periods usually of one to three hours and determined the changes in the ammonia content of the blood In control experiments they found that there was a small spontaneous rise of blood ammonia of the order of 25 per cent Expressing ammonia in milligrammes of nitrogen per litre a rise occurred from 1 09 to 1 36 in three hours When the blood was passed through the lungs for the same length of time the increase in blood ammonia was much greater—for example from 1 09 to 3 04, or by 180 per cent When polypeptide in a concentration of 1 gramme per litre was added to the perfused blood the rate of ammonia formation increased markedly—for example from 2 6 to 10 2 mg in three hours, or by nearly 300 per cent Similar additions to the blood in control experiments had no effect on the rate of ammonia formation The addition of glycine-glycine, or of the simple amino acids alanine or glycine, led to equally marked changes when the blood was perfused through the lungs Working with alanine they were able also to demonstrate that pyruvic acid was formed and that the respiratory quotient was lowered from 1 0 to 0 68 in three hours The rate of de-amination of alanine was not diminished by the presence in the perfusing blood of added quantities of pyruvic acid and ammonium carbonate These experiments indicate that the lungs may be normally concerned with certain phases of nitrogenous metabolism

ROYAL MEDICAL BENEVOLENT FUND

The one hundred and first annual meeting of the Royal Medical Benevolent Fund was held on March 16 Sir Thomas Barlow presiding It was announced that the King had consented to become patron of the Fund Mr R M Handfield-Jones in his report as honorary secretary after an account of the various activities of the centenary year said that the special appeal including Sir Thomas Barlow's generous gift of £1 000, had produced £4 532 from which the cost of the appeal (£660) must be deducted In addition 117 new subscribers were enrolled and as a result of a second appeal to practitioners living in the London district a further 220 making 337 in all A similar reminder was going out to practitioners in the rest of the country It was the intention to keep the centenary fund open for a few months longer It would be treated as capital and invested the interest being added to the amount available for annuities and grants The ordinary annual income from subscriptions and donations had risen by some £500 to £12 671 during the past year Reference was also made to special efforts in various parts of the country notably a centenary ball at Walsall which brought in £200 Five Divisions of the British Medical Association had also arranged social functions which resulted in generous contributions being forwarded to the Fund Another result of centenary publicity had been to increase the number of applicants During 1936 there were 136 new applicants and the total number of grants voted was 622 against 567 in the previous year At the end of 1936 there were 229 annuitants on the books, so that 851 persons in all had received financial help during the year, the total amount disbursed in charity being £21,447 The honorary treasurer (Dr Lewis G Glover) mentioned one or two further points A very small legacy of £286 received during the year was from one of the beneficiaries of the Fund, who had left to it the whole of her little capital The investments of the Fund now amounted to a book value of £192 000 their present market value being £228,000 He also referred to the important work of the Ladies' Guild, which administered about £7,000 a year in relief maintenance, education and various other forms of charity including the provision of clothes for the poorer beneficiaries Educational help was very important especially among the girls, and he thought the Guild might with advantage devote more of its funds to that side of the work the others being taken over by the Fund itself Dr Glover added that while the Fund received substantial backing from many quarters it still had not enlisted the support from the rank and file of the profession which it ought to enjoy He hoped that as a result of the centenary appeal the support would become more general

The resolution to adopt the report was moved by Mr Bertram Sutton who referred to the low level of administration expenses, and also to the promptitude with which applications were met In seconding Dr Herbert Spencer expressed disappointment at the result of the centenary appeal, it seemed to him that £4,500 was a very small sum to have been received from the profession especially in view of the example set by the president in his magnificent gift The report was adopted and on the motion of Sir D'Arcy Power seconded by Mr Sampson Handley, the president and other officers were re-elected, with thanks to them for their services The members of the committee of management who retire by rotation were also re-elected, these including Dr C O Hawthorne as representative of the British Medical Association One new member was appointed to the committee—Dr W G Harnett of Barnet The remainder of the meeting was occupied with complimentary proceedings The president expressed the indebtedness of the Fund to the medical journals for much valuable publicity and also thanked the British Medical Association for help received directly and indirectly The Panel Committees in different parts of the country were assisting but he agreed with what had been said that from the general body of the profession much larger contributions ought to be forthcoming He hoped that the Fund was at the beginning of a new period of prosperity which would surpass anything achieved in its long history In expressing the thanks and homage of the gathering to Sir Thomas Barlow, Mr Handfield-Jones referred to the fact that there was a difference only of nine years between the age of the Fund and that of its president and he hoped that in due time the Fund would have the joy of celebrating Sir Thomas's centenary

be made of it A doctor who made any physical examination without obtaining the prisoner's free consent given in full understanding of the nature and implications of the examination, would be committing an assault This is a criminal offence and would render him liable to a fine or the prisoner could sue him instead of, but not in addition to prosecuting him and perhaps obtain substantial damages, which need not be proportionate to the extent of the physical assault

This ordinary principle is however largely superseded for certain purposes by the Mental Deficiency Acts 1913–27 By the 1913 Act, s 8, when a court convicts a person of any offence for which he can be sent to prison or an industrial school and is satisfied on medical evidence that he is a defective it may take action to have him certified as a defective The court may act either on the evidence given during the trial or may call for further medical evidence If during the hearing the court considers that the accused person is a defective it may remand him to an institution for defectives or place him under guardianship pending the further hearing or trial before a higher court There seems to be no doubt that if a person is convicted of an offence punishable with imprisonment or is remanded in custody and the court thinks he is a mental defective it can order a medical examination without his consent or that of the parent or guardian if he is under age If consent had to be obtained it might be found impossible to administer the statute If however the person is not in custody, then consent must be obtained for any physical examination

Another provision in this section is that if the police consider that any person charged with an offence is a defective they shall communicate with the local authority and bring before the court such evidence as to the mental condition of the accused as may be available If they intend to produce such evidence they must give notice to the person charged and to his parent or guardian If the police ask the local authority to have the person examined by one of its medical officers the consent of the person to be examined or if he is under age that of his parent or guardian must be obtained before any act of interference with his person

In practice however consent is usually unnecessary because an experienced medical man can nearly always diagnose mental deficiency without even a technical assault In at least one metropolitan court the magistrate trying a person whom he suspects of mental deficiency remands him not for an examination but for a report The medical officer commits no assault by entering the room and conversing with the accused nor by getting him to perform tests Without touching the accused he can usually gain quite enough information to enable the court to consider that the accused person is a defective for the purpose of remanding him to an institution

I can find only one reported case of assault by medical examination under a magistrate's order and the aggrieved person there was a girl who was charged with concealing the birth of an infant and was forcibly examined to see if she had recently borne a child It is a far cry from ordering an examination of an accused person for the purpose of providing evidence against her to ordering an examination of an accused person who may be a mental defective and therefore a person who according to statute must be dealt with in a particular way which is not a penalty I think the Act by providing for certification of accused and especially of convicted persons on medical evidence must impart authority to obtain that evidence if necessary without consent I find confirmation for this view in S 4 (4) of the Act of 1913 A person presenting a petition to a magistrate must annex to it either two medical certificates or a certificate that a medical examination was impracticable When the petitioner certifies in this way the magistrate shall order a medical examination As the court trying a suspected defective have power to certify as though a petition had been presented to them they must surely have the ancillary power to order a medical examination

The case I have referred to is Agnew v Jobson The common law principles will be found in any textbook on common or criminal law, and the statutory provisions in the Mental Deficiency Act, 1913, s 8

PARKING OF DOCTORS' CARS

SIR,—I have read with some amusement the correspondence in the *Supplement* on this subject Let me quote you the following examples from fourteen years of midwifery practice in the West End of London (1) A placenta praevia case called down three times to remove my waiting car and instruments sepsis or danger to the patient did not seem to matter (2) Called out to a patient near death summoned, and appeared in due course and explained the position told that if I could not gauge the time of death the best thing to do was to engage a taxi , ten shillings costs (3) Hospital work as your correspondent suggests appears to be different the only difference lies in the fact that the duration of obstruction is longer and so the costs become 'one pound

Let me advise those who practise medicine to remember that a distinctive badge means publicity, and as such the suggestion for a badge for doctors' cars must be dismissed Unless our patients help us in reform of motoring laws then they must pay increased fees to cover hire of a conveyance to their bed of sickness—I am, etc,

London S W 5, March 19 JOHN H HANNAH M D

INDIAN MEDICAL SERVICE

In pursuance of the proviso to Subsection (2) of Section 3 of the Indian Medical Council Act 1933 (XXVII of 1933) the Governor General in Council has nominated Major General L W C Brid field C I E O B E as President of the Medical Council of India from February 13 vice Major General Sir C A Sprawson resigned

Major General Sir F P Connor K t D S O Surgeon General with the Government of Madras has been duly nominated by the Government of Madras under Clause (*a*) of Subsection (1) of Section 3 of the Indian Medical Council Act 1933 (XXVII of 1933), as a member of the Medical Council of India, vice Lieut-Col C Newcomb, resigned

Lieut Col A H Shukh has been appointed Deputy Director General Indian Medical Service as from January 15

Lieut Col W E R Dimond Assistant Director of Public Health, North West Frontier Province has been duly nominated by the Government of the North West Frontier Province under Clause (*a*) of Subsection (1) of Section 3 of the Indian Medical Council Act 1933 (XXVII of 1933) as a member of the Medical Council of India vice the late Col H H Thorburn

Lieut Col H S Cormack M C Medical Superintendent and Ophthalmic Surgeon General Hospital Rangoon has been appointed to officiate as Inspector General of Civil Hospitals Burma, vice Colonel N S Sodhi granted leave

A H O'Malley to be Captain (on probation) with seniority as Lieutenant September 25 1930 and as Captain September 25 1933

To be Lieutenants (on probation) with seniorities December 28 1935 A M McGavin, J D O'Shaughnessy, J E D Donnell D R Cattanach

A NEW METHOD OF CENTRIFUGATION

W J Elford[1] has recently described a new technique enabling the sedimentation rate of small particles to be studied with the ordinary bucket type of high speed centrifuge It consists essentially in arranging for an inverted capillary tube 1 cm long and 0 25 cm or less in diameter to dip into the main bulk of liquid contained in the centrifuge bucket By this means sedimentation may occur within the inverted tube under conditions for which Stokes's law may be directly applied The sedimented particles pass through the open lower end of the capillary tube and are collected on to a piece of filter paper After centrifugation for a given time at a given speed the capillary tube is withdrawn The fluid is retained within it by atmospheric pressure and capillary attraction From an estimation of the average concentration of particles in the fluid before and after a period of controlled centrifugation it is possible to calculate the average particle size in the suspension In practice an Ecco supercentrifuge was used capable of speeds up to 15 000 *revolutions per minute* The centrifuge cells were made of an aluminium silicon alloy of great tensile strength In order to increase the amount of liquid available for testing an arrangement was made permitting seven centrifuge cells to dip simultaneously into the fluid in each bucket The results obtained by this method were similar to those already reached by the Svedberg method of ultracentrifugal analysis and by the ultrafiltration method The mean diameter of *Chromo prodigiosum* was found to be 0 7 to 0 8μ and the mean density 1 10 The corresponding values for staphylococcus K phage were 60 to 70mμ and 1 25 The diameter of S 13 phage haemocyanine and edestin was 15 to 17mμ 22mμ, and 8mμ respectively It is interesting to note that the bacteriophages have densities approaching those of the proteins indicating a more compact structure than that of the bacteria

VENTILATION OF FACTORIES

The Home Office has published a third edition of its welfare pamphlet on the ventilation of factories and workshops[2] This calls for little comment as it closely resembles its predecessor The section dealing with propeller and pressure fans is excellent and is very well illustrated but the other sections almost inevitably suffer from the attempt to treat problems of ventilation by themselves apart from their relation to problems of heating For example mention is made of the discomfort caused by the air at head level being at a considerably higher temperature than that at foot level and the suggestion is made that the condition may be mitigated by means of a fan which will disturb and mix up the air Yet we find no reference to a much better method of avoiding high temperature gradients—namely to choose a suitable heating installation Again, no fewer than three illustrations are given of fan extraction at floor level on one side of the factory coupled with heating coils installed on the opposite side in such a manner as to send the warmed air to the ceiling This plan would cause the maximum discomfort to most of the workers in the factory for not only would the air temperature at head level be much higher than at floor level but there would be a continuous strong draught round the feet of the workers The section of the pamphlet specifically dealing with heating is only two pages in length so it is to be hoped that future editions will treat the subject much more fully and will describe it in combination with that of ventilation

THE NEW GREAT ORMOND STREET

On March 17 the Princess Royal revisited her training school when she performed the ceremony of laying the foundation stone of the main block of the new Hospital for Sick Children Great Ormond Street Her Royal Highness who is president of the hospital served there as a nurse during the war and it was therefore a very friendly ceremony since all those present were united in their great love of the institution The inscription on the foundation stone runs as follows

H R H the Princess Royal president of the hospital laid this stone round which the new buildings long planned in hope are to day rising in fulfilment 17th March 1937" This foundation stone is for the main block, which will contain the medical and surgical wards the operating theatres pathological and research departments together with the lecture rooms and library for the medical school The estimated cost of this part of the work is £240 000 and it is the second stage in the reconstruction of the whole place the first being the nurses home the last section of which is practically completed The new hospital will be a tall building consisting of two L shaped units communicating at the angles to make one long block on the north aspect with two wings running south so that by the skilful use of balconies on every floor there will be a sunny aspect for each ward This new building lies just short of the most northerly aspect of the present site of the old hospital and the old buildings will eventually be demolished giving place to a single story out patient block and administrative buildings An appeal has now been issued to the general public for the money necessary to pay for this next stage in the hospital's reconstruction and an attractive booklet is available on application to the secretary An institution which can boast of the names of Sir William Jenner Sir Thomas Barlow Sir Charles Ballance, and Dr W B Cheadle as former members of its staff should surely command public support because of the great importance of the work performed by those pioneers It is to be hoped that this will be speedily recognized

On March 22 Viscount Dawson of Penn was re elected President of the Royal College of Physicians of London

An announcement will be found in our University News of the appointment of Mr H L Eason M D F R C S to the post of Principal of the University of London from July 1 1937 to September 30 1941

Sir Charles Hastings Clinical Prize

The Sir Charles Hastings Clinical Prize, which consists of a certificate and a money award of fifty guineas is again open for competition in respect of 1938. The following are the regulations governing the award:

1. The Prize is established by the Council of the British Medical Association for the promotion of systematic observation research and record in general practice. It includes a money award of the value of fifty guineas.

2. Any member of the Association who is engaged in general practice is eligible to compete for the Prize.

3. The work submitted must include personal observations and experiences collected by the candidate in general practice and a high order of excellence will be required. If no essay entered is of sufficient merit no award will be made. It is to be noted that candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject though reference to current literature should not therefore be omitted when it bears directly on their results their interpretations and their conclusions.

4. Essays or whatever form the candidate desires his work to take must be sent to the British Medical Association House Tavistock Square London W.C.1 not later than December 31 1937. The Prize will be awarded at the Annual General Meeting of the Association to be held in July, 1938.

5. No study or essay that has been published in the medical press or elsewhere will be considered eligible for the Prize and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A prizewinner in any year is not eligible for a second award of the Prize.

6. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay the decision of the Council on any such point shall be final.

7. Each essay must be typewritten or printed must be distinguished by a motto and must be accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address.

8. The writer of the essay to whom the Prize is awarded may, on the initiative of the Science Committee be requested to prepare a paper on the subject for publication in the *British Medical Journal* or for presentation to the appropriate Section of the Annual Meeting of the Association.

9. Inquiries relative to the Prize should be addressed to the Medical Secretary.

Branch and Division Meetings to be Held

BIRMINGHAM BRANCH.—WARWICK AND LEAMINGTON DIVISION—Joint meeting with Pugo, Division at Manor House Hotel Leamington Spa Thursday April 8 8 p.m. Election of Representative and Divisional Committee. Address by the Retiring Division Chairman Lecture by Dr. George Bray. All are Welcome. *To be followed by Dinner.*

NORTH OF ENGLAND BRANCH.—NORTH SHIELDS DIVISION—At Whitley House Tuesday April 20 Clinical evening.

NORTH OF ENGLAND BRANCH.—NORTH SHIELDS DIVISION—A Quiz Night at Hotel Norfolk Friday April 2. Annual dinner.

NORTH WALES BRANCH.—At Rhyl Cottage Hospital Wednesday March 31 8.15 p.m. Discussion: The Cause of Loss of Time amongst Workers in Relation to Chest Affections of the Community. To be opened by Dr. Cecil G. Roberts Dr. P. P. Pinton Davies Dr. Bateman Dr. F. C. Davies and Dr. T. Wynne Jones.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—SWANSEA DIVISION.—Tuesday April 6 Clinical meeting.

STIRLING BRANCH.—At Stirling Infirmary Wednesday March 31 Afternoon clinical meeting.

SURREY BRANCH.—CROYDON DIVISION.—At Shirley Park Hotel Thursday April 8 7.45 p.m. Annual Dinner.

SUSSEX BRANCH.—BRIGHTON DIVISION.—At Grand Hotel Brighton Friday April 2 8.30 p.m. Mr. S. L. Higgs: Functional Treatment of Fracture. Film: Bolders Method of Treatment of Fracture. Preceded by supper at 7.30 p.m.

Meetings of Branches and Divisions

FIJI BRANCH

Two clinical meetings of the Fiji Branch were held during 1936. At the first when Dr. W. N. A. PATEY vice-president was in the chair Dr. J. CLUNIE gave a lecture on "The Surgery of the Thyroid Gland." Dr. Clunie said that interesting work had been done in New Zealand in recent years on the iodine content of foodstuffs and on iodine metabolism. A comparison between the Christchurch endemic centre in New Zealand and the goitre free island of Samoa was illuminating. The urine of twenty patients of Christchurch Memorial Hospital eleven of whom had goitre was examined. The mean excretion of urine per twenty-four hours was 1,600 c.cm. containing twenty micrograms of iodine. The control index for Canterbury area of which Christchurch was the capital was 64 per cent. The urine of twelve Samoans (goitre free) was found to have a mean iodine content of 189 micrograms per litre or 302 micrograms in twenty-four hour specimens 1,600 c.cm. The mean iodine content of six samples of Samoan blood was also determined and found to be 155 micrograms per kilogramme. The high urinary iodine excretion in Samoa was of course related to the high iodine content of Samoan foodstuffs. Goitre was present in the Sigatoka district of Fiji. It appeared to be most common in low-lying areas where the inhabitants drank well water. The incidence was mainly among the East Indians. The Fijians subsisted on a diet very similar to that of the Samoans. The agricultural Indians main diet was staple rice. It was hoped that with the establishment of a pathological laboratory in Suva research work on dietetic problems and on disease incidence would be begun within a few years. The colony with its relatively small population of peoples of differing races cultures and dietetic problems would prove a favourable field for the research worker. Exophthalmic goitre was not common among natives. It appeared to be as common among Indians as Europeans. Dr. Clunie concluded his lecture with a demonstration of several cases.

At another clinical meeting Dr. I. H. BEATTIE gave an interesting lecture at the Central Native Medical School Suva on "Species and Varieties of the Genus Homo" while Dr. T. CLUNIE discussed some experiences with radium and surgery at the Colonial War Memorial Hospital Suva. Dr. Clunie said that surgical diathermy quite apart from its value in the treatment of malignant conditions had been of use in the excision of tropical ulcers. In selected cases where general anæsthesia were inadvisable satisfactory result[illegible] on of infected tonsils by the electric needle. Excision of keloids by diathermy followed by surface application of radium had produced gratifying results. Sarcoma was not uncommon among native children. Carcinoma appeared to be much less common among natives than among Europeans and Indians resident in the colony. Rodent ulcer had a fairly high incidence among Europeans and was most often seen in fair subjects probably because of the irritating effects of prolonged sunlight on skins not sufficiently pigmented

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE HORMONE TREATMENT OF SOME DISORDERS OF PREGNANCY

BY

T. N. A. JEFFCOATE, M.D., F.R.C.S.Ed.

PART I

Pregnancy is normally accompanied by profound modifications of the whole endocrine system. The ovary, thyroid, parathyroid, adrenal, pancreas, and pituitary undergo well-recognized functional, and even structural, alterations, and a new ductless gland—the placenta—is temporarily added to the system. The products of these glands play a major part in the normal progress of pregnancy, and anomalies in their relative quantities or qualities are important factors in the causation of many of the pathological states; hence hormone treatment for disorders of gestation is being rapidly developed. Rational organotherapy is dependent on endocrinology, but since the origin and functions of the various hormones have been discussed elsewhere in this series only a brief relevant summary of physiological principles is included here.

Physiological Principles

The preparation of the endometrium for the successful embedding of the ovum is dependent on the corpus luteum hormone (progestin). The same hormone, by a direct action on the muscle, also inhibits uterine contractions, and thus prevents expulsion of the ovum. Nevertheless, in the human subject the corpus luteum is not essential to the progress of pregnancy after the sixth to eighth week. During the later stages of gestation uterine quiescence is determined by humoral factors whose identity is not yet proven. It is possible that the placenta secretes a progestin-like principle.

The gonadotropic hormones (prolan, prolan A and B), as their name denotes, act primarily on the gonad, and since they are responsible for the persistence and activity of the corpus luteum they indirectly inhibit uterine activity. In the human subject, however, they may also have a direct effect on uterine muscle, and this possibility is of importance in therapy, since it has never been convincingly demonstrated that the present preparations of gonadotropic hormones (from pregnancy urine or placenta) have a luteinizing action in woman.

As pregnancy advances the uterine muscle hypertrophies, its spontaneous contractions increase in number and amplitude, and it develops a sensitiveness manifested by enhanced ability to respond to both mechanical and chemical stimuli. These changes are the result of the direct action of oestrogenic hormones (oestrin) on the myometrium. The continuance of pregnancy is dependent on a hormonic balance in which the inhibiting principles predominate, and any disturbance of the balance which leads to an ascendancy of the oestrogenic hormones brings about the termination of pregnancy in the form of abortion or labour. But it is of prime practical importance to realize that this balance is not a simple quantitative one; thus a uterus under the influence of progestin cannot be excited by oestrogenic substances even if they are administered in relatively large amounts.

The role of the posterior lobe of the pituitary during pregnancy is still in dispute. It is quite possible that the powerful oxytocic secretion of this gland is concerned in initiating and sustaining the expulsive uterine contractions of parturition.

Principles of Treatment with Placental and Ovarian Hormones

HORMONE PREPARATIONS

Only preparations standardized in approved animal or international units are recommended. All others are relatively impotent and worthless. Whole gland products or "cocktail" preparations are whole-heartedly condemned. Under present conditions of manufacture or extraction reliable preparations are inevitably costly.

The standardized preparations most commonly used and easily available in this country are:

Corpus luteum hormone (progestin, progesterone)
- Proluton (Schering Ltd.)
- Progestin (Organon Laboratories)
- Progestin (British Drug Houses)
- Lutren (Bayer)

Oestrogenic substances (oestrin)

(*a*) Ketohydroxyoestrin
- Progynon (Schering Ltd.)
- Menformon or folliculin menformon (Organon Laboratories)
- Oestroform (British Drug Houses)
- Theelin (Parke, Davis and Co.)

(*b*) Oestradiol benzoate
- Progynon B (Schering Ltd.)
- Dimenformon (Organon Laboratories)
- Oestroform B (British Drug Houses)

Gonadotropic hormones (prolan, prolan A, prolan B) (From placenta and pregnancy urine)
- Pregnyl (Organon Laboratories)
- Antuitrin S (Parke, Davis and Co.)
- Gonan (British Drug Houses)

Gonadotropic hormones are easily destroyed by heat, and should be kept in a cool store and injected from a cold syringe. Even under ideal conditions *solutions* of these hormones rapidly deteriorate, and they should not be used later than four months after manufacture.

MODE OF ADMINISTRATION

Oral administration of hormones other than thyroid and oestrogenic extracts is futile. Moreover capsules of the latter have a very limited application since these hormones are only one-fifth as active when administered by mouth as when injected parenterally. The gonadotropic, pituitary, and corpus luteum hormones are completely inactivated by digestive juices. Intramuscular or subcutaneous injections are with a few exceptions preferable to intravenous medication.

DOSAGE

Most hormones are better given in divided doses than in a single massive one. In the body they are quickly destroyed, inactivated, or excreted, and to obtain a maximal and continued effect injections should be repeated at regular and frequent intervals. Continuity of treatment

Through the courtesy of Dr J H L Cumpston, Director General of Health for the Commonwealth of Australia a supply of radium had been made available for use at the Colonial War Memorial Hospital Despite the fact that no radium was available for gynaecological use some dramatic results had been obtained in cases of what appeared to be inoperable carcinoma of the cervix by the preliminary use of diathermic excision of fungating masses followed by the application of 2 mg radium needles Rodent ulcers near the eyes were excised and the area, where necessary skin grafted Those which were seen late in such areas as the cheek or the alae of the nose, with deep penetration, were treated by radium and the results so far had been very good It was necessary, however, to watch the cases carefully, as recurrence had been seen in a rodent ulcer of the cheek treated elsewhere by radium two years previously The results of treatment by radium and diathermy of such conditions as rodent ulcer carcinoma of the penis and cervix etc had been so good that it was confidently expected that more patients would come up for treatment within the next few years At present the majority of malignant cases came up for treatment at a late stage

LANCASHIRE AND CHESHIRE BRANCH BLACKBURN DIVISION

At a meeting of the Blackburn Division held at Blackburn on March 2 Dr RALSTON PATERSON (Manchester) delivered a British Medical Association Lecture on Radium and X Rays in the Treatment of Malignant Disease An interesting discussion followed

LANCASHIRE AND CHESHIRE BRANCH WARRINGTON DIVISION

At a meeting of the Warrington Division held on February 26 Dr C A PAULUSZ outlined the local scheme under the Midwives Act 1936 It was arranged to begin a course of eight sessions on air raid precautions by Dr L T Challenor, medical instructor for the Liverpool Centre on March 24

LINCOLNSHIRE BRANCH LINCOLN DIVISION

At a meeting of the Lincoln Division held at Lincoln on February 25 with Dr G C WELLS COLE in the chair Sir WILLIAM WILLCOX gave an address on 'The Medico-Legal Aspects of Medical Practice' The audience included several members of the Lincoln Law Society

Sir William said that in spite of the drift toward State medicine less forensic medicine was taught to-day than formerly The medical man need not be afraid of the witness box as the atmosphere of the law courts was very different from what it was a few years ago and practitioners were treated with great courtesy by counsel With regard to professional secrecy Sir William said that the doctor was bound to tell everything in the witness box He urged doctors to develop a medico-legal conscience and instanced cases of food poisoning and of typhoid in which notification and precautions were of paramount importance Sir William dealt with some aspects of toxicology He discussed certain special poisons and poisoning from belladonna arsenic and mercuric chloride finishing up on a note of warning about the indiscriminate use of the barbiturates

Questions were asked by Drs WILSON J LYONS C A H FRANKLYN and SHARRARD The meeting ended with a hearty vote of thanks to Sir William Willcox for his most interesting address proposed by Mr LANGLEY (the senior member of the legal profession present) and seconded by Dr H B WILLOUGHBY SMITH

NORTHERN IRELAND BRANCH NORTH EAST ULSTER DIVISION

At a meeting of the North East Ulster Division held at Magherafelt on February 19, with Dr SLOAN M BOLTON in the chair Professor R J JOHNSTONE President Elect of the British Medical Association, read a most interesting paper on maternity services in Northern Ireland He said he intended to ask for information from country practitioners rather than to give it He then raised many points on which the authorities wished to find out the experiences of doctors in rural districts For instance, the facilities available for ante-natal and post-natal care and treatment for sepsis the extent to which midwives had replaced doctors and if this was desirable whether the unqualified midwife still existed what arrangements were made for anaesthetics in difficult cases and how the services of specialists were obtained when necessary Professor Johnstone insisted that every primipara should see a doctor, also every difficult multipara and all patients should have the benefit of a post-natal examination Septic cases should always be treated in hospital In closing Professor Johnstone suggested that the Division might form a small committee to obtain information on the points mentioned, in which case he would be glad to arrange for one or two members to give evidence before the Interdepartmental Committee in Belfast at present considering these problems An interesting discussion followed, and on the proposal of Dr HEGARTY seconded by Dr EVANS an enthusiastic vote of thanks was given to Professor Johnstone for his address

The usual silver collection for medical charities was taken and the meeting adjourned for tea

SHROPSHIRE AND MID WALES BRANCH

At a meeting of the Shropshire and Mid Wales Branch, held at the Royal Salop Infirmary on March 2, Dr ARNOLD STOTT delivered a British Medical Association Lecture on 'Cardiac Diseases from a Clinician's Point of View"

Dr Stott advocated the rejection of the older views of the significance of physical signs and symptoms in heart disease He pointed out that there were very few symptoms or physical signs of heart disease which really helped in the diagnosis or prognosis of the condition and insisted that the state of the function of the heart as a whole was of more importance than the actual lesion Two of the few exceptions to this general rule were the presence of (*a*) pulsus alternans which carried rather a grave prognosis especially in cases of high blood pressure and (*b*) refilling of the jugular veins during diastole in the semi-recumbent patient which was to be regarded as a sign of dilatation of the right heart He pleaded that each heart condition should be classified first according to its aetiology secondly, the functional condition present, thirdly, [illegible] damage evident He pointed out that a [illegible] was responsible for a very large number of deaths there was as yet no national effort directed towards its prevention such as there was in tuberculosis and cancer In spite of this, however acute rheumatism in children which constituted one of the chief causes of heart disease appeared to be on the decline, With regard to methods of examination of the size of the heart Dr Stott was sceptical of the value of percussion and pointed out that radiographic results had to be carefully interpreted

The meeting was very well attended and closed with an interesting discussion in which many members took part A vote of thanks to Dr Stott was carried with acclamation

STAFFORDSHIRE BRANCH NORTH STAFFORDSHIRE DIVISION

At a meeting of the North Staffordshire Division, held at the North Staffordshire Royal Infirmary on March 4, with Mr E H RICHARDS in the chair Mr A LAWRENCE ABEL delivered a British Medical Association Lecture on Common Diseases of the Rectum and Anal Canal Mr Abel showed coloured cinematograph films of the modern operation for haemorrhoids and of the abdomino-perineal operation for carcinoma of the rectum The lecture was clear and instructive and was thoroughly enjoyed by all present On the motion of Mr W C ALJARDICI seconded by Dr G L LEFEVRE a vote of thanks was accorded Mr Abel for his address Before the lecture tea was provided by the chairman and in the evening a dinner was held at Hanley

YORKSHIRE BRANCH GOOLE AND SELBY DIVISION

A meeting of the Goole and Selby Division was held at Selby on February 23 with Dr W B HILL in the chair The CHAIRMAN extended a hearty welcome to the president of the Branch Mr L Dougal Callander After certain business matters had been dealt with the members were shown a film presented by Messrs T J Smith and Nephew Ltd entitled 'The Modern Treatment of Fractures with Cellona Plaster'

YORKSHIRE BRANCH HARROGATE DIVISION

A joint meeting of the Harrogate Division and the Harrogate Medical Society was held on March 5 with Dr SINCLAIR MILLER in the chair The audience included the president of the Branch Mr L Dougal Callander

Dr H P HIMSWORTH delivered a British Medical Association Lecture on 'The Treatment of Diabetes Mellitus and the Use of the Protamine Insulins' The full text of this lecture appeared in the *Journal* for March 13 (p 541) A good discussion followed in which the CHAIRMAN Mr W LODGCOMBE, Dr C W C BAIN and Dr GEOFFREY HOLMES took part On the motion of the CHAIRMAN a vote of thanks was accorded Dr Himsworth for his address

YORKSHIRE BRANCH HUDDERSFIELD DIVISION

At a meeting of the Huddersfield Division held at Huddersfield on February 3, with Dr F GAMM in the chair, Dame LOUISE MCILROY delivered a British Medical Association Lecture on 'The Indications for and against Surgical Intervention in Obstetrical Practice' The full text of the lecture will shortly appear in the *Journal*

NOTES OF THE WEEK

Scottish Advisory Council on Physical Training

The Scottish National Advisory Council on Physical Training has now been constituted Its members include Dr W L Burgess, Professor E P Cathcart, Mr W A Cochrane Dr G C Cossar, and Professor P S Leleman

Library of the British Medical Association

The librarian has submitted to the Library Subcommittee his report for the year 1936 It shows that the number of readers (that is the figures of attendances and borrowings) who used the library during the year was 25,220 The number of books borrowed was 16,819, and 42[illegible] requests for literature on some specific subject were dealt with The number of individual members using the library was 3,339 this figure representing 1,152 town members and 2,187 country members, and 898 books were added to the library during the year

Contributory Scheme at Huddersfield

The Huddersfield and District Contributory Scheme has just been formed to provide hospital benefit for persons over the age of 16 whose income does not exceed £312 per annum Free treatment will be available to subscribers and their dependants at the Huddersfield Royal Infirmary on the recommendation of a qualified medical practitioner, and payment will be made on behalf of subscribers and their dependants to other hospitals when treatment is given on the recommendation of a member of the honorary medical staff of the Huddersfield Royal Infirmary or in cases of emergency occurring outside the area of the Infirmary

Physical Recreation Site for National Training College

A committee of the National Fitness Council on March 18 considered the question of the site of the new National College for the training of teachers and of leaders for the Keep Fit clubs and classes The committee took the view that if a suitable site could be found within London's green belt that would probably best meet the case and not less than 50 acres would be needed if possible a site of something nearer 100 acres should be acquired It is understood that the committee had before it several suggested sites some of which were eliminated for reasons of size inaccessibility locality or the unsuitable nature

[illegible]

Precautions for Hospital Staff at Rugby

The Board of Management of the Hospital of St Cross Rugby has advised the members of the [illegible] staff who are also members of the [illegible] to accept [illegible] to [illegible] 20 each [illegible] [illegible] [illegible]

POST-GRADUATE COURSES AND LECTURES

APRIL AND MAY

The following post graduate courses and lectures to be held in London during April and May have been notified to the British Medical Association Further particulars may be obtained direct from the hospitals concerned or in the case of arrangements made by the Fellowship of Medicine (F M) from the Secretary of the Fellowship 1 Wimpole Street W 1

Subject	Date	Place of Meeting	Nature of Instruction
Arthritis	April 5 12 19 26 May 3 10	British Post Graduate Medical School Ducane Road W 12	Course of lectures
Chest Surgery	April 7 14 21 28 May 5	"	Lectures demonstrations
Experimental Cancer Research	April 7 14 21 28 May 5 12	"	Course of lectures
Eye Diseases of	April 5 16	Royal Eye Hospital St George's Circus Southwark S E	F M E out patient
Gynaecology Present-day (continued)	April 7 8 May 6 13	British Post Graduate Medical School Ducane Road W 12	Lectures demonstrations and practical work
Plastic Surgery	April 14	Princess Elizabeth of York Hospital for Children Shadwell E	F M demonstrations
"	April 15	149 Harley Street and St Andrew's Hospital E W 1	

In addition to the above courses the following for the higher qualifications have been arranged

Subject	Date	Place of Meeting	Degree or Diploma
F M Course in Anatomy and Physiology (cont)	April 2- May 24	Infants Hospital Vincent Sq S W 1	F R C S (Primary)
F M Fundus Oculi demonstration	April 6	West End Hospital for Nervous Diseases Gloucester Gate Regent's Park N W	M R C P
F M Pulmonary Tuberculosis demonstration	April 3	Preston Hall near Maidstone Kent	M R C P
L C C Course XX Part II Psychological Medicine (cont)	April 5- May 27	Maudsley Hospital Denmark Hill S E 5	D P M

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses ophthalmology at Royal Eye Hospital April 5 to 17 plastic surgery April 14 and 15 general practitioners course in neurology at West End Hospital April 19 to 24 heart and lung diseases at Victoria Park Hospital April 10 and 11 fevers at Park Hospital April 17 and 18 infants diseases at Infants Hospital April 24 and 25 cancer at Royal Cancer Hospital April 24 and 25 On Saturday April 3 there will be an all day demonstration on pulmonary tuberculosis at Preston Hall Maidstone and on Tuesday April 6 at 8 30 p m there will be a demonstration on the fundus oculi Both these demonstrations are intended for M R C P candidates Detailed syllabuses of all courses can be obtained from the Fellowship of Medicine 1 Wimpole Street W

The Joint Tuberculosis Council announces that Dr R R Trail and Dr Peter Kerley will hold a combined clinical and radiological course on diseases of the chest at the Royal Chest Hospital City Road E C from Wednesday March 31 to Saturday April 3 The fee for the course is £2 12s 6d and all inquiries should be addressed to Dr William Brand honorary secretary for post graduate courses Joint Tuberculosis Council 8 Christ Church Place Epsom Surrey

A course of three lectures by Professor E Kretschmer of Marburg will be given at the Institute of Medical Psychology Malet Place W C on April 20 21 and 22 at 8 30 p m On April 20 Professor Kretschmer will discuss Heredity and Constitution in the Aetiology of Psychic Disorders on April 21 The Structure of the Personality in Relation to Psychotherapy and on April 22 Instinct and Hysteria The lectures are open to medical graduates only and the fee for the course is 12s 6d Tickets must be obtained in advance from the educational secretary at the Institute

DEVON COUNTY COUNCIL —Assistant County M O H Salary £500- £25 £700 p a

DORCHESTER DORSET COUNTY HOSPITAL —H S (male unmarried) Salary £150 p a

THE MEDICAL PROFESSION AND LOCAL AUTHORITIES

The trend of medical and social progress in Great Britain in recent years has involved a closer community of interest between the medical profession and local authorities than existed in the past. Not only are local authorities providing medical services of many types on a large scale but the increased interest in the general well-being of the nation and in the prevention of illness has produced new problems of organization and administration which concern equally local authorities and the medical profession. It follows therefore, that the most efficient medical and allied services, whether for the healthy or the sick, will be the result of friendly and helpful co-operation between the profession and the local authorities and it should be the endeavour of each Division and Branch of the B.M.A. to secure in its area the establishment of a medium for co-operation and negotiation. In some areas informal co-operation already exists in some a scheme has been arranged for a specific purpose, and in a few a permanent advisory committee to the medical officer of health has been appointed through the machinery of the local B.M.A. constituency.

An advisory committee of this type established on a permanent basis is the most desirable medium for co-operation for its active existence will be an assurance to the local profession that the latter will be consulted as a matter of course by the authority concerning any new scheme or any extension of an existing one. And not only so, but it will also ensure that the profession is consulted in the initial stages. Too often the local profession is unaware of proposals affecting it until the latter are well developed when it is much more difficult to secure amendment. An advisory committee of the type suggested can obviate much friction and reduce the labours of the Division or Branch.

The kind of committee in mind may be exemplified by the Essex Advisory Committee which is appointed by the Branch and consists in addition to a chairman and a convener of a representative of the Branch Council and a representative of each of the four Divisions. It meets every three or four weeks and discusses with the county medical officer of health medical problems of interest and importance to the local authority and the profession. A brief consideration of some of the services which are of equal interest to the local authority and the profession will show how much important work there is for a standing advisory committee to perform.

Local Authority Clinics

A considerable amount of the medical work of a local authority is performed through the medium of clinics, whether for maternity and child welfare, minor ailments, venereal diseases or some other service. It will be remembered that some years ago Dr. Alfred Cox, then Medical Secretary of the B.M.A. visited a number of welfare centres of various kinds organized by local authorities, and came to the conclusion that much of the work performed at these clinics could be performed just as easily and efficiently by general practitioners and that the clinics were encroaching on the sphere of private practice. After considering Dr. Cox's report the Council of the B.M.A. passed a series of resolutions showing how the services of private practitioners might be utilized by local authorities and recommending the extension of the system of part-time employment at clinics so that the private practitioner should co-operate with the administrative medical officer. The Association believes that the participation of the private practitioner in the clinical work of the services provided by the local authority is in the best interests of the public health. To press upon the local authority the ideals of the profession in this respect and to negotiate with it the terms upon which private practitioners shall be employed, is work which can best be performed by an advisory committee to the medical officer of health.

A notable illustration of the advantages of the part-time employment of private practitioners at local authority clinics and of co-operation in the area is afforded by the ante-natal work undertaken by local authorities, for it is obviously to the benefit of a woman to be examined during her pregnancy by the doctor who would be summoned if medical assistance were needed at her confinement. This principle has indeed been recognized by a number of local authorities, and schemes have been introduced, sometimes after consultation with the profession, to enable any pregnant woman, within certain income limits, to receive two or three ante-natal examinations by a medical practitioner of her choice. The whole subject of maternal mortality and morbidity has received much attention from local authorities during the past few years and calls for the closest co-operation between these bodies and the medical profession. In the execution of their obligations under the Midwives Act 1936 some local authorities have co-operated formally with district nursing associations and it is equally desirable that there should be some standing arrangement for co-operation with the local medical profession.

Public Assistance

The Local Government Act of 1929 transferred to local authorities the functions of the boards of guardians including the provision of a domiciliary medical service for public assistance patients. A number of authorities have put into practice the Association's principle that these persons should be entitled to treatment by a doctor of their choice and not by a specially appointed official doctor. The formulation of a "free choice" scheme, the preparation of a panel of general practitioners offering their services, the consideration of the method of remuneration and the calculation of a capitation fee where this method is adopted, are all questions which must necessarily be subjects of consultation between the M.O.H. on behalf of his authority and the local profession. If there is already in existence an advisory committee appointed by the local Division or Branch of the Association this will obviously be the body to conduct negotiations on behalf of the profession. Then when the scheme is in operation the assistance of the advisory committee will be required for purposes of the disciplinary control of the practitioners taking part, the expression of opinions on questions relating to the interpretation of rules and arbitration in case of dispute between a participating practitioner and the local authority. The schemes of some authorities expressly provide for the appointment of an advisory committee by the local Division to consider any question of a medical nature that may arise in connexion therewith.

Hospital Policy

The Local Government Act was also a milestone in the progress of hospital organization and questions of municipal hospital service and accommodation are increasing in number and in importance. Many of them are of vital interest to medical practitioners and the advice of the local organized profession should be avail-

EALING HOSPITAL FOR SICK CHILDREN, Southwark, S E—(1) Ophthalmic S Honorarium £52 10s (2) H S (male) Salary £120 p a

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s, which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTHS

BROWNING—On March 10, to Dr and Mrs S Barratt Browning, at Wellington House, Handsworth Wood, Birmingham, a daughter

WILKINS—On February 6, at the Baptist Mission Hospital, Berhampur, Ganjam, India, to Dr Honor E C Wilkins (née Harvey), wife of Dr E Gordon Wilkins of Baptist Mission, G Udayagiri, Ganjam, India, a son (David Gordon)

DEATHS

ATTLEE—John Attlee, M D, aged 67, late of 65, Grosvenor Street, W 1, son of the late John Attlee of Dorking Died in Welling borough, March 8, 1937

CONWAY—On March 19, at 2, Clifton Avenue, Fallowfield, Manchester, Basil Wiseman Conway, M R C S Eng L R C P Lond, the very dear husband of Jane Conway Was interred at St Paul's Church, Stalybridge, on Tuesday, March 23

PEREIRA GRAY—At 3, Northernhay Place, Exeter, on March 13, 1937, Joseph Pereira Gray, M D, aged 68 years

ible to the local authority Such questions include the medical staffing of hospitals remuneration the treatment of private patients in hospital by general practitioners the treatment of contributory scheme patients, the use of the out patient departments the provision of specialist services and co operation between voluntary and municipal hospitals If there is a standing advisory committee to the medical officer of health the profession will be assured that its views are receiving consideration if there is no such arrangement the profession may find that the local authority is promoting a hospital policy in opposition to the principles which the Association believes to be in the best interests of both the doctor and the patient and that it is difficult to obtain amendment after the policy has been put into operation

So far as co operation between voluntary and municipal hospitals is concerned one joint hospitals advisory board includes a representative of the local Branch of the B M A but this is not so in all areas in which such boards have been formed It is therefore suggested that in any area where the formation of a joint board is under consideration the Division or Branch concerned should submit to the appropriate authority the desirability of including a representative or representatives of the local organized profession in the personnel of the board

Diphtheria Immunization

Other departments of social medicine in which the services of general practitioners may suitably be employed and which are therefore subjects for consultation with the Division include diphtheria immunization A few local authorities in an endeavour to increase the proportion of their population protected against diphtheria and to promote the knowledge of the advantages of immunization, have enabled parents to have their children immunized by their private practitioners Here again the approach to the profession by the local authority may well be through an advisory committee to the medical officer of health

Social Services

In addition to the provision of medical services there are certain questions of general social interest in which the local profession the local authority and other local organizations each play a part A campaign for public education in health for example demands the united efforts perhaps under the leadership of the local authority of a number of different types of organization In such a case the Division might consider that the advisory committee to the medical officer of health should act as its representative or the Division might itself through the advisory committee, initiate a campaign A similar subject is physical education, in which local authorities are taking or soon will take, an active interest In the present state of the movement there appears to be some danger that the medical and scientific aspects will not receive their due share of attention but if, when the local authority considers its programme for physical education, there is in existence some liaison between it and the Division the latter will have an opportunity of impressing upon the local authority the importance of the medical aspect

Precautionary measures against air raids have recently been the subject of discussion in many areas and some local authorities are preparing schemes for public propaganda and instruction The success of these schemes and indeed of the whole of the precautionary measures will depend to a very considerable extent upon the co operation of the medical profession The assistance and advice of the local organized profession should therefore be easily and continuously available to the local authority

It is in such directions as these that an advisory committee to the M O H can render valuable service both to the profession and to the community On matters of general policy it would be the mouthpiece of the Division and for the purpose of particular schemes of medical service it would act as a liaison between the profession and the local authority It is therefore suggested that in those areas where no such arrangements for co operation yet exist the Division or Branch should consider the question of discussing with the M O H the desirability of establishing some permanent arrangement for mutual co operation on all questions concerning medical services of the area

PUBLIC HEALTH NOTES

Local Authorities and Birth Control

Many local authorities have wished to provide facilities by which poor mothers in their district could obtain advice on birth control but until 1931 they were unable to secure the powers to do so In March of that year however the Ministry of Health issued Memorandum 153 M C W pointing out the extent to which local authorities could arrange for advice to be given to women on contraceptive methods There were three procedures

1 Advice could be given to those married women attending the maternity and child welfare centres in whom further pregnancy would be detrimental to health It was suggested that such advice should be given at a separate session of the centre and under conditions which would not disturb its normal and primary work

2 While local authorities had no general powers to establish birth control clinics under the Notification of Births (Extension) Act which enabled authorities to exercise the powers of the Public Health Acts for the purpose of the care of expectant and nursing mothers birth control clinics could be provided for these limited classes of women Approval of the establishment of such clinics was to be conditional on contraceptive advice being given only in cases where further pregnancy would be detrimental to health

3 Under the Public Health Acts gynaecological clinics could be established for women who were in need of medical advice and treatment for gynaecological conditions and where contraceptive advice might be given to married women attending such clinics in whom pregnancy would be detrimental to health In Circular 1408 issued on May 31, 1934 the opinion is expressed that where such a clinic is established it would be proper also for married women suffering from other forms of sickness physical or mental—for example from organic diseases such as tuberculosis heart disease diabetes chronic nephritis etc—to be afforded contraceptive advice if it is found medically that pregnancy would be detrimental to health What is or is not medically detrimental to health must be decided by the professional judgement of the registered medical practitioner in charge of the clinic

The extended scope as indicated in Circular 1408 does not go as far as is desired by many particularly by those who realize the effect on many women of the fear of pregnancy and also by those who would wish to give advice on the spacing of pregnancies On February 2 1937 the Minister of Health received a deputation organized by the National Birth Control Association which pointed out the inadequacy of the present provisions and the limited use made of their powers by local authorities and expressed the opinion that increased provision would

is further improved if the hormones are given in an oily medium absorption from the tissues then takes place more slowly Most preparations of corpus luteum and oestrogenic hormones are now supplied as solutions in oil

TIME RESPONSES

As a rule there is no *immediate* response to injections of these hormones The inhibiting action of progestin and gonadotropic hormones is seen in a few hours, although it is stated that when large doses are used an effect may be produced within fifteen to thirty minutes Oestrogenic substances however, do not influence uterine contractions until six to twelve hours have elapsed and the maximum effect is not apparent until at least twenty to twenty four hours after an injection

Threatened Abortion

The hormone treatment of threatened abortion does not replace but is accessory to the present well established methods of treatment with sedatives and rest Gross causes such as uterine retroflexion must be excluded or corrected The object of organotherapy is essentially to allay expulsive uterine contractions by inhibition of the muscle For this purpose corpus luteum hormone should be administered intramuscularly in doses of 2 international units daily from the onset of symptoms until one week after pain and bleeding have ceased Subsequently especially for patients with a known tendency to abort injections of 1 international unit should be made twice weekly up to the thirty second week of pregnancy For patients showing no response to treatment the dose may be increased and 10 international units in single or divided doses may be injected daily without harmful effect

As an alternative to progestin gonadotropic hormones may be administered—also with the object of bringing about uterine quiescence The dosage should be 100 rat units, injected twice daily this should be continued until the patient has been free from symptoms for one week On occasion the amount prescribed may be increased to as much as 500 rat units daily but the present commercial preparations are apt to give rise to mild local or general reactions when injected in large amounts

Although good results are reported for the treatment of threatened abortion with progestin or prolan failures are not infrequent This is only to be expected when the foetus is dead or the membranes ruptured, and success is unlikely and indeed undesirable, in the presence of foetal abnormalities—a common cause of abortion

Whereas either of these methods of hormone treatment may be used with advantage, progestin therapy is the more efficacious

Repeated Abortion and Habitual Death of the Foetus

In many cases of habitual abortion, defective placental implantation, or repeated intra uterine death of the foetus, no cause can be found In such circumstances it is conceivable that an upset in the pregnancy endocrine balance is the underlying fault

The management of such cases is based on the same principle as is that for the treatment of threatened abortion, and has for its object the maintenance of uterine quiescence Treatment should be begun as early as possible in pregnancy or perhaps before conception occurs In the latter case the object is to prepare a healthy pregravid endometrium, and to this end 1 international unit of progestin should be injected twice weekly during the second half of each menstrual cycle—beginning about the sixteenth day after the first day of the last menstrual period This progestational treatment is less important than therapy during pregnancy and is of theoretical rather than practical value Moreover its application is difficult and it may have to be continued for several months because the occurrence of conception is so fortuitous

As soon as pregnancy is established inhibitive hormones (progestin 1 international unit twice weekly or gonadotropic hormone 100 rat units twice weekly) should be given and their administration continued until the thirty second week of pregnancy It is generally considered advisable to discontinue the treatment after this time for fear of prolonging the pregnancy past term this is only a remote contingency Some clinicians insist that doses as small as 1/25 rabbit unit of progestin are equally efficacious in preventing habitual abortion and many state that it is unnecessary to continue treatment after the fourth month In my opinion it is unwise to give less than the dosage recommended above

For some years past habitual abortion has been treated extensively with corpus luteum tablets, and many clinicians have claimed results which are quite as imposing as those published for the newer progestin preparations Such corpus luteum tablets for oral use contain very little if any progesterone and are incapable of producing hormonic effects in the body Treatment with these preparations is therefore purely empirical and the claims made for their usefulness serve to emphasize the difficulty in assessing the value of any form of treatment for such a condition as habitual abortion

Another form of organotherapy is now becoming increasingly popular—namely the administration of thyroid The rationale is more obscure than that which defines the use of other hormones but it is based on the fact that the body during pregnancy makes great demands on the thyroid and that enlargement of this gland is frequently present in cases of habitual abortion Moreover there is experimental evidence to show that the presence of an optimum amount of thyroxine is important for the progress of normal pregnancy Whatever the exact rationale may be thyroid therapy is undoubtedly as good as, if not better than the other forms of hormone treatment outlined above It is less costly and can be given orally The dose recommended is thyroid extract 1 grain each day throughout the duration of pregnancy It may be combined with the other methods of hormone therapy In spite of the difficulty in assessing results the evidence now accumulated leaves no doubt that treatment with gonadotropic corpus luteum or thyroid hormones is successful in a large number of cases Of the types of organotherapy mentioned I prefer to use thyroid extract combined when financial and other circumstances permit with progestin

Although it is permissible to assume the presence of an endocrinous causal factor in many cases of unexplained habitual abortion and death of the foetus this assumption is not always justified, and other factors such as vitamin deficiency not infrequently play a part Since the present state of knowledge precludes more accurate subdivision of these cases from the aetiological standpoint treatment should never be limited to organotherapy Attention to general health, and avoidance by the patient of constipation coitus, and strenuous physical exercise remain essential to the management of these cases The administration of vitamin E is especially important accessory treatment Furthermore it is well to remember that for cases of habitual death of the foetus induction of premature labour is carried out as a routine by some authorities

lead to a reduction not only in maternal mortality and morbidity but also in criminal abortion It urged the Minister to issue a circular encouraging local authorities to establish gynaecological clinics in which birth control should take its proper place as part of the general medical care of women, and indicating the lines on which the clinics should be run

Sir Kingsley Wood, in reply, pointed out the limitation of activities imposed by Parliament on both the Minister and local authorities, and that in a matter of this kind any alteration in policy should receive Parliamentary approval He contemplated that in a report he was shortly expecting on a two years investigation into the problem of maternal mortality one of the recommendations would relate to the need for the extension of post natal clinics At such clinics facilities would be available for the medical examination and treatment of women who had recently been confined, and birth control advice could lawfully be given there to any women in whom pregnancy would be detrimental to health, but he considered it desirable that such advice should be given at a separate session The establishment of post-natal clinics would also doubtless reveal the need in many areas for gynaecological clinics These would be provided under the Public Health Acts, and would be available to any woman suffering from gynaecological conditions, at them contraceptive advice could lawfully be given to those women in whom further pregnancy would be detrimental to health

Maternity Work in Cheshire

Until recent years notwithstanding the fact that an ante natal clinic was provided as part of the maternity and child welfare services of the town no ante-natal work was done at Winsford Cheshire as the women did not attend the clinic A detailed scheme for an ante-natal service by general practitioners to be paid for by the local authority was drawn up and approved by the Minister of Health After these arrangements had been in operation for a short time the maternity and child welfare services in Winsford were transferred from the town council to the Cheshire County Council, who agreed to continue with the scheme Later, in 1933, representations by the Cheshire Local Medical and Panel Committee to the county council resulted in the extension of the arrangements throughout the county, this being the beginning of a scheme which as the general practitioner ante-natal scheme, has been put into operation in many districts throughout the country

In 1935 the Local Medical and Panel Committee set up a subcommittee to review the maternal deaths for the county for the previous three years this subcommittee consisting, apart from county administrative officers of general practitioners familiar with domiciliary midwifery and its difficulties In the report on the findings of this subcommittee, which has been published stress is laid on the importance of nutrition bearing in mind that 'malnutrition is not merely underfeeding but a disorder of the processes of nutrition brought about as a rule by habitual use of food of improper quality While agreeing that want of ordinary food was not the outstanding cause of death, the subcommittee is of opinion that the quality of the food is a matter of great importance and that a fall in the maternal mortality rate would follow if the dietary recommended by Sir Robert McCarrison, whose advice was at the service of the sub committee, were more general

The absence of ante natal supervision or disregard of advice given appeared to be the most important factors in a number of cases Premature application of forceps was considered to be the primary avoidable factor in thirteen cases After a review of these the report continues

The contemplation of these cases must give rise to two reflections (1) That if indeed the low forceps operation carried out on no other indication than a tedious labour were the primary avoidable factor the error must be very venial, for it is commonly employed under these circumstances with satisfactory results Probably every member of the committee has frequently so employed it, but the examination of a series of disasters in a way not ordinarily available supplies a truer vision of cause and effect than the study of isolated cases and has led us to regard some of our ideas (2) That a single kind of primary avoidable factor inadvisable application of forceps was responsible for the initiation of at least four different classes of consequences—shock haemorrhage, retained placenta and sepsis

Commenting on two cases in which patients were removed to hospital in the third stage of labour the subcommittee holds "that the old obligation of student days to remain in continuous supervision of a uterus that contains a placenta still obtains and in addition, transport in the third stage increases the risks of haemorrhage and shock In another case the transporting to hospital of a patient suffering from a concealed accidental haemorrhage was considered to be the primary avoidable factor

The main conclusions and recommendations of the committee are

'(1) That the injudicious use of forceps adds a percentage to the maternal mortality and morbidity The masterly policy of inaction up to a point which clinical wisdom alone can assess is the line to follow (2) Conversely that in cases of post partum haemorrhage with retained placenta bolder treatment undertaken if need be in consultation—but in this case the decision must be taken quickly—is wiser than prolonged delay Manual extraction of the placenta is a major operation The fingers must reach the fundus and complete their task whatever their skill it is of no avail if they carry sepsis

The opinion is expressed that it should be possible to obtain the services of a second general practitioner as anaesthetist or for the giving of a second opinion the county council to be responsible for the payment of the fee of one guinea in such cases

Public Health Appointments

The following changes have recently been made in the public health service medical staffs

Dr W D T Brunyate to be assistant medical officer for Staffordshire and medical officer of health for the urban and rural districts of Stone

Dr H K Cowan assistant medical officer of health for Leicester to be medical officer of health for Gloucestershire

Dr G W T H Fleming, medical superintendent of Hereford City and County Mental Hospital to be medical superintendent of Burnswood House Gloucester

Dr J R W Hay medical officer of health for Cleethorpes and Grimsby Rural District Council to be medical officer of health for Kirkcaldy

Dr W D Hyde to be deputy medical officer of health and assistant school medical officer for Enfield

Dr W R Martine assistant medical of health and school medical officer for Croydon to be assistant medical officer of health for Birmingham

Dr P J O'Connell deputy medical officer of health for Barking to be medical officer of health for Beddington and Wallington

Dr A E Wall medical officer of health for Tipton, to be medical officer of health for Swinton and Pendlebury

Dr K Boyes to be assistant maternity and child welfare officer for Salford

---

Dr A F Kidd is to retire from the post of school medical officer for Dundee

Dr C H Harvey medical officer for Thornaby, has resigned

The death is announced of Dr F W Alexander formerly medical officer of health for Poplar

The death is announced of Dr T Harper, medical officer of health for Stranraer

Finally, it must be emphasized that the successful culmination of one pregnancy as the result of treatment does not mean that the underlying cause of the abortions has been permanently corrected Similar therapeutic measures must be adopted in each subsequent pregnancy

Therapeutic Induction of Abortion

In view of the ability of oestrogenic substances to increase uterine sensitivity it seems at first sight that their administration in large amounts at any stage in pregnancy should lead to the onset of expulsive uterine contractions However, reference has already been made to the fact that the so-called 'hormone balance" does not imply a condition of simple quantitative equilibrium, but rather a qualitative state in which either oestrin or progestin is dominant This is certainly true for the human subject, and it is now proved conclusively that normal pregnancy cannot be terminated in its early stages even if millions of units of oestrogenic hormone, together with large doses of posterior pituitary extract, are administered If, however, the foetus is dead and retained *in utero*—a condition which implies a disturbed hormone balance—expulsive uterine contractions can be developed by hormone agents (see later)

Induction of Labour, Prematurely or at Term

Use of Posterior Pituitary Hormone—Extracts of the posterior lobe of the pituitary have long been used for purposes of medicinal induction of labour Their injection is usually preceded by the administration of castor oil and one of the salts of quinine I recommend quinine sulphate, 10 grains repeated three times at one hourly intervals, followed by four injections, at one-hourly intervals, of 5 units of pituitary principle Any medicinal method of induction of this type usually fails to bring on labour unless the pregnancy has reached term or unless the uterus is unduly sensitive

Use of Oestrogenic Hormone—In late pregnancy, when the influence of inhibiting factors is waning the administration of oestrogenic hormones undoubtedly increases uterine sensitivity Nevertheless they must be given repeatedly for several days, and even then their sensitizing action is so unreliable that the subsequent application of powerful oxytocic factors, such as quinine and posterior pituitary extract, fails to bring on uterine contractions in at least 50 per cent of cases A method of induction of labour which is uncertain and so slow as frequently to take seven or eight days to bring about its effect is of little practical value But oestrogenic substance may be helpful as an accessory to mechanical induction of labour, more particularly when artificial rupture of the membranes or the intra-uterine insertion of bougies or stomach tube has failed to bring on expulsive uterine contractions In such cases 20,000 to 40,000 international benzoate units (100,000 to 200,000 international units) of oestradiol benzoate injected intramuscularly, four-hourly, appear to improve uterine tone and lead to the onset of labour within twenty-four to forty eight hours

(*To be continued*)

At the March meeting of the Central Midwives Board for England and Wales the revised list of approved teachers as submitted was approved for the purpose of the conduct of training under the present rules of the Board, subject to satisfactory replies to questions in certain cases The application of Eric Arthur Gerrard, M D , for approval as examiner was granted

MEDICAL RESEARCH COUNCIL

ANNUAL REPORT FOR 1935-6*

Clinical Research

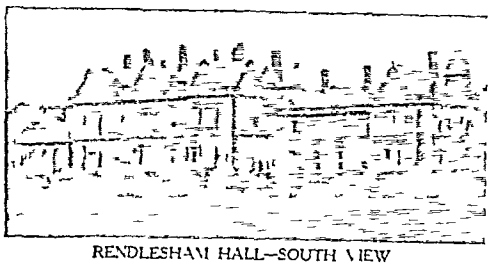
The Medical Research Council staffs and supports (save for the post of director, which is endowed by the Rockefeller Foundation) the department of clinical research at University College Hospital, London, and supports the directors of the clinical research unit at Guy's and the neurological research unit at Queen Square Some interesting work from each of these departments is embodied in the report of the Council

The report from University College Hospital is largely occupied with Sir Thomas Lewis's studies of the effects of embolism and other work on vascular disorders G W Pickering has been engaged here in a series of investigations concerning the mechanism of high blood pressure It has been shown that the carotid sinus mechanism remains active in persistent hypertension, but the observation that changes in arterial and venous pressures produced by the intravenous injection of small quantities of adrenaline are greater in subjects with nephritic and malignant hypertension than in normal subjects and those with essential hypertension was not confirmed A quick transfusion of as much as 600 c.cm of blood from patients with essential hypertension into anaemic patients has been shown to produce only very small rises in blood pressure, no greater than in those produced by similar quantities of normal blood

At Manchester Royal Infirmary one of the many external-research schemes supported by the Council has been directed to an investigation into the aetiology and treatment of *pernicious anaemia and other diseases of the* blood-forming organs Some 800 patients with pernicious anaemia are now under regular observation and in those who co-operate adequately it has been found relatively easy to maintain good health and normal blood counts by modern methods of treatment Further work on the properties of haemopoietin supports the view that this intrinsic anti-anaemic principle of stomach is an enzyme, but the nature of the extrinsic factor has yet to be determined At Aberdeen further investigations have been made on the treatment of pernicious anaemia by the Dakin and West liver fraction, marrhaemin and it appears that for most cases one injection of 5 c.cm of marrhaemin every eight weeks suffices to maintain the blood count at a satisfactory level

In Sir David Wilkie's department at Edinburgh part time grants have been made to two workers engaged on the study of causes of death after extensive burns The tissue fluid from the burned area has been found to contain poisonous substances produced by chemical breakdown of the damaged cells and independently of bacterial action Clinical observations suggest that the acute and severe toxaemia which develops soon after extensive burns can be successfully treated by extracts of suprarenal cortex At Glasgow University other grantees have shown that fracture of bone with adjacent muscle damage leads to a rapid increase in the normal breakdown of protein and hence to increased excretion of nitrogen in urine and of creatine also, when the muscle only is damaged and the bone not fractured the nitrogen loss is much less

Neurology



At Queen Square Hospital London, a study of the dynamics of the cerebro spinal fluid which the unit began

**Report of Medical Research Council for 1935-6* Cmd 5378 London H M Stationery Office (3s net) Notice concluded from March 20 (p 616)

THE RESIDENTIAL TREATMENT OF ALCOHOLISM & DRUG ADDICTION

RENDLESHAM HALL

(Postal Address)—WOODBRIDGE, SUFFOLK

RENDLESHAM HALL—SOUTH VIEW

Rendlesham Hall which is open to receive patients, is essentially a Sanatorium Its daily life and routine are that of an ordinary comfortable holiday or health resort, or of a large country house Each patient has all the privileges of a guest consistent with the prescribed medical treatment. Rendlesham Hall has 45 bedrooms, and about 450 acres of gardens and park It has also a private nine-hole golf course, tennis and croquet lawns, and bowling green

Illustrated booklet giving particulars as to terms, etc, can be had on application to the

BETHLEM ROYAL HOSPITAL, for Nervous and Mental Disorders,

Monks Orchard, Monks Orchard Road, Eden Park, Beckenham, Kent

Reg Tel Address Bethlem Beckenham *Telephone* Springpark 1180-1181

Station Eden Park (Southern Railway)

President VISCOUNT WAKEFIELD OF HYTHE G C V O
Treasurer SIR LIONEL FALDEL PHILLIPS Bart
Physician Supt J G PORTER PHILLIPS M D F R C P

This Registered Hospital is now situated at Monks Orchard in some 200 acres of park pleasure and farm grounds
Applications can be considered on behalf of patients of the educated classes in a presumably curable condition
With a view to early treatment voluntary or uncertified patients are admitted
Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to admit patients free of charge
Every facility for specialized investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit In this unit is found X Ray, and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories
Furthermore provision is made for Electro-Therapy and Hydro Therapy to be carried out in all their forms and Occupational Therapy under competent instruction is encouraged
In addition to the Resident Medical Staff Consultants in special branches of medicine and surgery are available whenever required
The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms
For forms and further particulars apply to the Physician Superintendent at the Hospital

two years ago has been continued, and by varying the posture of the subject and the degree of vascular congestion within the cranial cavity it has been shown that the lumbar cerebro spinal fluid pressure is a direct reflection of the lumbar venous pressure and independent of the elasticity of the spinal theca

Among various work undertaken at mental institutions an examination has been made of the trypanocidal activity of the cerebro spinal fluid after injections of trypparsamide and other pentavalent and trivalent arsenicals It seems likely that the method will have practical value for determining the probable efficacy of new compounds of this type before they are subjected to large scale clinical trials At the Bernhard Baron Institute of Pathology at the London Hospital work has been proceeding on tumours arising in the meninges of the brain or spinal cord It has been found in the course of this work that the migrating tumour cells of some meningiomata contain intranuclear inclusion bodies similar to those previously described in the gliomata Attempts are being made to shed light on the nature of these bodies and their possible relation to the filterable viruses

Tuberculosis

During the year under review various research has been undertaken into tuberculosis A Stanley Griffith with J Smith at Cambridge has determined the types of tubercle bacilli responsible for 436 cases of the pulmonary disease in North East Scotland, of which 207 were in the city of Aberdeen and 229 distributed in the rural districts In the former series 6 3 per cent were infected with bovine tubercle bacilli and in the latter 9 1 per cent The percentage incidence of bovine infections in North East Scotland is higher than in other parts of the country In the Department of Tuberculosis Welsh National School of Medicine, further work has been done on the powers of coal and other dusts to adsorb the active principles of tuberculin and to render it less toxic Observations have been continued on the chemotherapeutic action in tuberculosis of a gold compound prepared by Sir Gilbert Morgan of the Chemical Research Laboratory Teddington Encouraging results have been obtained in laboratory tests but it is too early as yet to assess clinical value Enid Williams has investigated the medical after histories of a series of old and retired coal miners first examined by her in 1930 Her findings suggest that the symptomless type of pulmonary tuberculosis which occurs in elderly men with pneumonoconiosis progresses rapidly once it reaches a stage at which it can be diagnosed by sputum examinations

Bradford Hill has continued a study of the epidemiology of phthisis in young adults, and indicates that one of the factors responsible for the relatively unfavourable mortality in this country at the young adult ages is a change in the volume and direction of the internal movement of population as between country and town The theory he advances seems very tenable though it has some obscure points

In connexion with the late results of the treatment of pulmonary tuberculosis by artificial pneumothorax attention is drawn to a report by F J Bentley who suggests that having regard to the large number of deaths from tuberculosis of the lungs in young male adults this treatment might well be used more extensively in such cases Admittedly it is a treatment of limited application but one of great importance among properly selected individual sufferers for whom it sensibly increases the expectation of life and of working capacity

Vitamin Studies and Nutritional Problems

From several of the external research schemes work on the vitamin problem is still being reported At the Lister Institute some studies of the B vitamins in wheaten flour and bread, not yet completed, indicate so far as they have gone that white bread and white flour contain more vitamin B_1 than has hitherto been supposed, and that both white flour and wholemeal flour are good sources of vitamin B_6 but relatively deficient in flavine J C Drummond and his assistants at University College London, working with a grant from the Council have continued their researches into the chemistry of vitamin A and vitamin E Attempts are being made to isolate a crystalline derivative of vitamin A from which it may be possible to separate the vitamin in pure form At several centres the vitamin C reserves of human subjects as measured by urinary excretion of the vitamin have been studied Volunteers have been given graded allowances of vitamin C, and it has been shown that its excretion is quantitatively related to intake It has been confirmed that in fever the vitamin is used up in the body at a rate faster than normal so that an increased intake of the vitamin may be desirable in convalescence Particularly low values have been found among patients with a history of gastric and duodenal ulcer

Various studies on diets are briefly summarized Among other matters observations have been made on the effects of severe salt deficiency on the general well being of normal persons and particularly on the function of the normal kidney It has been shown that one remarkable result of extreme salt deficiency is the reproduction in large measure of the symptoms and signs of Addison's disease At the Lister Institute a study has been made on the influence of diet on reproduction in rats The findings so far support the conclusion that the rate of parturition and the power to raise offspring can be increased by adding an extra ration of unsaturated fatty acids to a diet containing all the known essential factors

Work on the subject of iodine and goitre has been directed by a special committee appointed jointly by the Medical and the Agricultural Research Councils The results of this investigation contained in a report already issued in the Council's series are briefly that an environmental deficiency of iodine is related to the incidence of goitre Two English counties Somerset and Suffolk have been taken for study In the former the incidence of simple goitre is high and in the latter it is low The iodine content of the waters of Somerset is consistently lower than that of the waters of Suffolk though milk and pasture samples from the two counties show no significant differences in iodine content

Various Work

Fruitful work is recorded on almost every page but space limits us to mentioning only two or three more instances At Cardiff City Mental Hospital an investigation has been started on the metabolism of acetylcholine It has been shown that when slices of tissue from the brain cortex are supplied with oxygen in a medium containing esterase a substance believed to be a choline ester is formed which produces a powerful contraction of sensitized leech muscle

In the field of chemotherapy earlier reports have mentioned the preparation of two arsenical derivatives which have been found to give promising curative results in experimental trypanosomiasis A satisfactory process has now been devised for producing one of these on a suffi-

(patient's serum against donor's cells) it was found that no less than sixty five minutes were taken for agglutination to occur, and it has ever since been my practice whenever possible, to allow at least one and a quarter hours for the cross test

My object in writing this letter is to inquire whether sufficient time was allowed in these fatal cases for a serum weak in agglutinating power to act fully These low titre sera are probably not so rare as one would expect I am unable to appreciate the suggestion of anaphylaxis as a cause inasmuch as anaphylaxis should be impossible with two bloods of the same species, but a toxic anaphylaxis is perhaps implied? Incidentally, to prevent renal blockage the prior use of sodium citrate to render the urine alkaline will convert a potential renal blockage into a harmless haematuria—I am etc,

Normal Labour Under Analgesia after Temporary Sterility

SIR,—The following case of temporary sterility followed by a normal labour under modern methods of analgesia presents points which may be of general interest the patient being herself qualified and in medical practice

At age 34 after five years married life she was admitted to hospital for lipiodol injection and x rays, the first showed tubes of abnormal outline and doubtful patency and three small opacities in the position of the left ovary The second injection under greater pressure appeared to open up the tubes and the radiograph showed lipiodol in the peritoneal cavity and the outline of a dermoid cyst the three opacities being teeth The potential risk of torsion and possible effect as a deterrent to pregnancy were considered adequate grounds for removing it The cyst was found to be inseparable from the left ovary and the mass was removed *in toto* a blood cyst was excised from the right ovary whose covering was abnormally thick, and a pathological appendix was removed at the same time

Five months later two injections of 1 c.cm antuitrin S were given at intervals of thirty six hours at the beginning of a menstrual cycle the second produced distressing symptoms suggestive of hypoglycaemia but not the desired result Six months later again four injections of 1/4 c.cm were given at intervals of three days and pregnancy occurred the following month

A first labour at 36 in a patient with a history of rickets in childhood and only moderate muscular development suggested careful watching in the later stages of pregnancy and Caesarean section was discussed however the child's head engaged satisfactorily and labour was allowed to proceed naturally, although its onset occurred a fortnight after the expected date It began at 3 a.m with a show and the membranes ruptured at 11 30 a.m but pains were not evident until five minutes after an injection of pitocin at 12 30 p.m At 2 30 they were beginning to be uncomfortably strong and thenceforth until the end of the first stage the patient inhaled 30 per cent N_2O in air from a Siebe Gorman apparatus at every pain For five and a half hours this gave complete relief without affecting the frequency or effectiveness of the uterine contractions and between pains she was able to read and even to enjoy a tea party At 5 p.m there was barely one finger dilatation At 8 p.m the pains began to be so strong as to occasion some discomfort even with the apparatus in action, nevertheless the time seemed to her to pass very quickly as she slept between pains At 10 p.m, the beginning of the second stage gas oxygen and ether were given by an anaesthetist at first intermittently, this was less satisfactory as owing to the degree of pain needed to wake her from the anaesthetic administered during the previous contraction she had not time to warn the anaesthetist of the onset of the next one and consequently felt each pain acutely and she found the ether very unpleasant So she was after a short while kept under continuously and the baby a girl weighing 9¾ lb was born at 12 20 a.m Forceps were used rather to control the head prior to crowning than because tractive assistance was needed There was no damage whatever either to mother or child The mother had remained lying down throughout labour she did not even brace her feet against the foot of the bed and pull on a towel or bear down She did in fact nothing but inhale the analgesic at every pain Twelve hours later she was sitting up in bed enjoying a good meal and feeling perfectly well without any stiffness or discomfort whatever

To sum up, the points of note are

1 An unsuspected dermoid cyst diagnosed solely by *x* ray (possibly the first occasion on which this has occurred)

2 Pregnancy following its removal and injections of antuitrin S (There is of course no proof of cause and effect)

3 The very rapid recovery by a primipara of 36 with only moderate muscular development from the birth of a 9¾ lb baby involving twelve hours of strong and frequent pains after premature rupture of membranes

While admitting the unwisdom of generalizing from the particular one is tempted to attribute (3) to the very effective analgesia available and suggest that the wearing effect of long drawn out severe pain in unrelieved labour *plays a large part in the exhaustion which too often* follows If there is any truth in this the relief of that pain becomes not a sentimental gesture undertaken from humanitarian motives but a bounden duty incumbent on all of us who are engaged in the effort to reduce maternal mortality and industrial disability

I am indebted for permission to publish details of this case to Mr L C Rivett who conducted it throughout I enclose my card but the patient being my wife I ask you to suppress my name—I am etc

M A CAMB

Radiograph or Skiagram

SIR—I am in complete agreement with Mr R S Lawson's letter on this subject even to the extent of believing that the public and the profession will go on calling a skiagram an *x* ray But skiagram is the word On April 1, 1896, I exhibited at a meeting of the Obstetrical Society of London a Skiagram of a Sirenform Monster, and published it in volume 38 of the society's *Transactions* (for 1896 p 118) more than three years before the earliest mention of the word in the *New English Dictionary* (*Athenaeum*, September 2, 1899)—I am etc,

London, W 1 March 20 HERBERT R SPENCER

Why "Nocifensor" System of Nerves?

SIR,—Another barbarous expression is apparently being added to the many for which classical scholars accuse us The correct form of the new word is *nocufensor* Nocifensor is as wrong as document innocious or moniment, since for verbs in eo the compounding stem ends in u I called attention to this fact years ago when the shocking compound anoci association was put forward instead of innocu association

Would it be possible for Sir Thomas Lewis to withdraw his term and substitute the correct form nocufensor? For purposes of medicine one term may be as useful as the other, but in the eyes of our critics—the classical scholars—nocifensor is as dreadful as the howlers in medicine appearing in ordinary advertisements are to us medical men—I am etc,

Shepton Mallet March 11 F J ALLEN M D Cantab

cient scale for therapeutic trial, and a preliminary trial on human patients is now in progress

Work has been done at University College, London, on the properties of the aqueous and vitreous humours of the eye in relation to changes in intra ocular pressure It has been shown that although the vitreous gel is capable of turgescence the degree to which it can retain water in excess of normal is so slight as to make it impossible that such a swelling in itself could cause the symptoms of glaucoma In glaucoma the salt concentration of the vitreous humour has been found to exceed that in the blood—a reversal of the normal state

During the year the Council has issued two reports recording investigations on deafness, a quantitative study, and one on the relief of deafness by instrumental hearing aids In the present report the importance of the study of deafness from the angle of prevention is urged Some two and a half million people in this country suffer from some degree of deafness, and middle-ear disease is at the very top of the list of causes of rejection of Army recruits A good deal of direct research on problems of hearing and on diseases of the ear is mentioned, but has not yet reached the conclusive stage

In the field of genetics the medical staffs of a number of hospitals in London and the provinces have continued to co-operate with the committee of the Council concerned with this subject by supplying data for a large scale statistical inquiry into the incidence of consanguineous parentage among patients suffering from different conditions Owing to the rarity of such marriages much greater numbers of records are required before any conclusions can be drawn regarding the existence of defects due to recessive inheritance At the Galton Laboratory Julia Bell has obtained two pedigrees illustrating linkage between two sex-linked diseases—haemophilia and colour-blindness

In commenting last year on the loss to higher medical education caused by the withdrawal of the wider scheme of Rockefeller fellowships, the hope was expressed that it might be possible partially to fill the gap by augmenting the number of medical travelling fellowships from other sources The award of such fellowships by the Rockefeller Foundation ceased with the academic year 1935-6, but the Council has been able to provide, in two cases from its own funds and in another by the kindness of the Leverhulme trustees, three new travelling fellowships in medical science The three Fellows are now all working at centres in the United States Research fellowships in tuberculosis have also been awarded for the present academic year to four persons, all of whom are studying clinical problems of tuberculosis at centres abroad

---

G Bini (*Arch ital Anat Istol patol*, June 1936, p 270), who records three illustrative cases in patients aged from 20 to 53, made an examination of the endocrine system in two cases of Graves's disease and one of Addison's disease associated with hyperthyroidism In the first and third cases the hypophysis showed only slight changes On the other hand, in the second case a cyst which occupied the anterior lobe of the hypophysis reduced the active part of the parenchyma to a minimum, the eosinophil cells being affected most of all In the first case the thyroid showed an adenoma accompanied by numerous colloid cysts, while in the second and third cases it had the appearance of a colloid goitre with the microscopical changes characteristic of Graves's disease Nothing unusual was found in the other glands apart from complete caseous necrosis of both suprarenals in the third case In the second and third cases the liver showed evidence of fatty degeneration, atrophy, and infiltration

Local News

ENGLAND AND WALES

Manchester University's Appeal

On March 16, at a meeting held at the Town Hall, an appeal was made for financial support for the development and extension of Manchester University A capital sum of £300,000 is needed, and new annual subscriptions to the extent of £10,000 Included in the proposed expenditures are £35,000 on accommodation for the social sciences departments, £30,000 on the long promised new medical library, £5,000 on a surgical research laboratory, £10,000 on extensions to the department of pathology and bacteriology, and £8,000 on provision for physical education Including the gift of the dental hospital by Mr Samuel Turner (reported in these columns on March 6, p 523), subscriptions have been promised amounting to almost £150 000 Owens College was founded in Manchester in 1851, though the charter which made Manchester a separate university was not given until 1903 The history of the University is a distinguished one, and the magnitude of the plans for the immediate future is some measure of the strides which have been made in the last thirty years

Marie Curie Hospital Opening of Research Laboratories

Queen Mary, patron of the Marie Curie Hospital, Hampstead, opened on March 19 the hospital's new and enlarged laboratories providing facilities for clinical and pathological research The laboratories are named in memory of the late Dr Helen Chambers honorary pathologist to the hospital Lord Dawson of Penn who presided, welcomed Queen Mary, and on behalf of those running the hospital, expressed gratitude for Her Majesty's interest in and encouragement of their work He also welcomed Mlle Eve Curie, daughter of the late Mme Marie Curie, and Dr Henri Coutard, director of the x ray therapy department of the Curie Foundation, Paris Lord Dawson reminded those present that just over forty years ago Mme Curie and her husband, while investigating uranium, discovered a new element which they named radium From that discovery proceeded a veritable romance of science It was soon noted that a plate containing the minutest quantity of the new element, when brought into the vicinity of the skin produced reactions That led on to the treatment of human diseases by radium Knowledge concerning the physics of radium was largely due to Englishmen, and thus the culture of France and the culture of England had brought extensive blessings to mankind The Marie Curie Hospital was founded in 1929 for the treatment by radiotherapy of women suffering from cancer and allied diseases Nearly 4 000 cases had passed through the wards Of the thirty-nine beds twenty nine were devoted to uterine cancer As a result of treatment extending over five years as many as 85 per cent of the cases taken at an early stage were free from the disease at the end of that period Of the cases in which the disease was firmly established when treatment began 65 per cent enjoyed freedom at the end of the five years Even among those in whom the disease was far advanced when the patients first reached the hospital the results were encouraging and at times astonishingly so The laboratories would stand as a memorial to Helen Chambers, would fill a gap in the hospital's work, and assuredly open a new chapter of increasing beneficence to both doctors and patients Mlle Eve Curie said the hospital itself represented one of the realizations of her mother's hopes though from its foundation Madame Curie regretted that the hospital had no research laboratory The opening of the Helen Chambers laboratories would establish the balance between medicine and pure

Abortion in France

SIR,—The views of Dr Paul Balard, which you have usefully summarized in an annotation (March 20 p 621), show, when worked out, that about 21,000 women die annually in France from criminal abortion The repressive measures against birth restriction have proved worse than futile, yet he proposes more of them Moreover, if they were to achieve the miracle of being effective they would raise France's birth rate to 30 per mille and her death rate to over 25 In England we fortunately have Professor Carr-Saunders and other leading sociologists urging that voluntary parenthood must be the basis of a satisfactory population policy I contend that there will be a great amount of involuntary parenthood until abortion is made available to any mother of two children—unless it were possible and preferable to induce people to get sterilized when they have as many offspring as they can provide for You rightly advocate that early marriage should be made easy and attractive, but this could only be financially possible if my eugenics idea were carried out of alone paying for the children of the first two effective confinements—I am etc,

London, S W 15 March 20 B DUNLOP

Obituary

JOHN ATTLEE, M A M D

John Attlee, who died on March 8 at Wellingborough at the age of 67 years, was a successful practitioner from 1895 first in Brook Street W and then for many years in Grosvenor Street W Matriculating at St John's College Cambridge in 1886, he was in 1889 placed together with the late A S F Grunbaum (Leyton), afterwards professor of pathology at Leeds in Class II of the first part of the Natural Sciences Tripos In October of that year he entered the medical school of St Bartholomew's Hospital with the Shuter Scholarship founded in 1886 in memory of James Shuter for Cambridge medical students and awarded for anatomy and physiology Qualifying in 1892 at the Conjoint Board and M B, B Ch Cambridge Attlee was ophthalmic house-surgeon and external midwifery assistant at the hospital, and house-surgeon at the East London Hospital for Children Like many other men at St Bartholomew's, he came under the inspiring influence of A A Kanthack the first whole time teacher of pathology in a London medical school, and in his laboratory carried out an experimental and pathological research into the adrenal cortex this formed the substance of his thesis for the M D degree, and was published in the *Medical Chronicle* Manchester After entering practice Attlee kept in touch with hospital work, being clinical assistant at the Westminster Ophthalmic Hospital and on the staff of the Hospital for Consumption, Margaret Street, W He was a fine figure of a man, cheerful able radiating kindness and confidence, and with many friends and patients He was a member of the British Medical Association for twenty-five years

Dr Lewis G Glover writes

In Dr John Attlee there has passed away one of the best type of practitioners he was a man devoted to his profession and interested in every advance made during the years which have elapsed since he qualified in 1892 I first knew him at the beginning of our Cambridge days, and having once made each other's acquaintance our friendship has never slackened throughout Though in later years we only met occasionally, the same kindly smile greeted one, and the same readiness to talk over old times and compare notes and experiences was there as always We began our studies together, and we went through our whole course together, and I shall never forget the value and help to me which it was to have such a kindly friend His genial nature endeared him to all who knew him, and he was in consequence one of those about whom one never heard an unkind or harsh word of criticism I cannot speak of his relations with his patients beyond saying that I am sure he was beloved by all He did his duty to all, without any push or self-assertion Such men as he are the backbone of the profession, when they arrive at their well earned rest we recognize that we are losing from the profession something which is not so easily to be replaced in these days of change

Dr T Wilson Parry writes

I would wish to add a brief tribute in connexion with the decease of my old friend John Attlee, not so much respecting his professional attainments but rather as to his character We were at Amersham Hall School together over fifty years ago, and, as Wordsworth tells us "The boy is father of the man" so Attlee as a schoolboy exemplified this aphorism in the highest degree when in adult years he attained distinction in medical practice as a physician and oculist He was always the same modest, retiring courteous personality whether at school college or among his old schoolfellows in the Amersham Hall fellowship when we met for lunch dinner or on other occasions Attlee was a fine example of a medical man with painstaking accuracy and reliability such as became a first-class man in a splendid profession His friends may take assurance in the fact that "to live in hearts we leave behind is not to die"

DR EDWIN JAMES WENYON who died on February 20 at the age of 84 had practised in Dundee for thirty-six years As a student first in Edinburgh then in London Dr Wenyon had a brilliant career His London B A was followed by the B Sc degree with honours in experimental physics he won the science entrance scholarship to Guy's Hospital in 1878 exhibitions in 1879 and 1880, and the Sands Cox exhibition in physiology in 1880, when he qualified M B in 1883 he was awarded the gold medal in anatomy and gained honours in physiology He first served as house-surgeon at Guy's Hospital and then spent some time at the Rotunda Dublin After several years in the Orkneys and a short period in his native county of Staffordshire he settled finally in Dundee Dr Wenyon's interests were many and diverse He was a wide reader in several languages, and a keen critic of men and events the world over In his earlier days farming and agricultural chemistry attracted him Riding was for many years a favourite exercise, and he "broke in several horses for his own use he was also a keen fisherman In his prime he could defy any challenger at chess, and to the last remained a strong and frequent player of that game No hobby or sport however roused in him such absorbing interest as did children He waged constant war on errors of diet whether the result of ignorance carelessness or poverty Associated with a wide experience and clinical skill was a remarkable and lovable personality His humanity and unfailing kindliness and his cheerful disposition radiated help and courage As one of his friends has said "To a multitude of young and old he was more than their doctor he was their

science which Marie Curie considered indispensible to any institution in which radium treatment was given British scientists had been among the first to acknowledge the value of M and Mme Curie's scientific discoveries and England was the first country to take a practical interest in those discoveries Now hospitals for the treatment of cancer by radium existed in all the countries of the world Dr Coutard in wishing the hospital and the new laboratories every success, said that the results already obtained by the Marie Curie Hospital were among the best achieved in any part of the world Mrs Walter Runciman, chairman of the Board of Management offered thanks to Queen Mary for her presence and added that the friends of Helen Chambers were raising a special fund to pay for the equipment of the laboratories, but between £4 000 and £5 000 was still required to complete the payment for the building of them Among those present at the ceremony were the Polish Ambassador Sir Cuthbert Wallace President of the Royal College of Surgeons Lord Horder Sir Lenthal Cheatle, Professor Winifred Cullis, Miss Chadburn Professor Sidney Russ and Dr W E Gye

Treatment of Fractures

At a luncheon given in London on March 16 by the Industrial Welfare Society Mr H E Griffiths F R C S gave an address describing work in the treatment of fractures Mr R S Hudson Parliamentary Secretary to the Ministry of Health in moving a vote of thanks to Mr Griffiths said that in 1935 more than 1 300 000 accidents were treated at hospitals in Great Britain, and these included over 200 000 cases of fracture Unfortunately in the past many of these injuries had left the patients suffering in varying degrees from permanent incapacity and loss of earning power Modern methods of treatment in special fracture clinics resulted both in a very much shorter stay in hospital and in a reduction of the after ill effects It was for this reason that the Minister of Health and the Home Secretary had set up a committee under the chairmanship of Sir Malcolm Delevingne to consider the best arrangements for restoring the working capacity of the injured Mr Hudson then spoke of the interest taken in this problem by the Industrial Welfare Society The society could exercise a powerful influence both through employers and through workers associations Industrialists were beginning to realize the enormous amount of personal suffering as well as loss of time and wages which resulted from these injuries and which could be reduced by modern methods In some cases they had made substantial contributions to the cost of treatment He suggested that groups of employers or workers who were contemplating action on these lines should put themselves in touch with the committee

Royal London Ophthalmic Hospital

The annual dinner of the Royal London Ophthalmic (Moorfields) Hospital took place on March 11 at the Langham Hotel Mr T Harrison Butler presided and in responding to the toast of the school the dean Mr Charles Goulden incorporated his report He said that the school was flourishing and that students had joined the hospital in larger numbers than previously During 1936 104 new students joined the hospital and seventy-four old students continued their attendances The examination results had been satisfactory The Gifford Edmond prize had been awarded to Mr J Bruce Hamilton of Hobart Tasmania (an old student and senior resident officer), for his essay on the Significance of Heredity in Ophthalmology Apart from continuous clinical instruction 623 hours of lectures had been given Mr E F Fincham delivered a series of lectures on modern ophthalmic instruments and Professor S P Bedson on allergy Six series of demonstrations had been given to students of the British Post Graduate Medical School at Hammersmith Sir Stewart Duke Elder had resigned from the hospital staff and Sir John Parsons who had lectured on physiology since 1919, had also resigned his lectureship To replace these the school had secured the services of Dr R J Lythgoe Reader in Physiology of the Special Senses in the University of London Dr Russell Brain had retired and in his place Dr Denis Brinton had been elected to the staff Mr Frank Law had joined the staff and undertook the classes in practical surgery Mr C D Shapland had been appointed curator and pathologist and Mr R C Davenport sub dean The school still felt the need of a proper professorial unit in which full time officers could give more attention to the teaching Under the present arrangement it was impossible to do more and recently the help of chief clinical assistants had been obtained to give tutorial classes and these had been much appreciated

SCOTLAND

Edinburgh Mental Hospital

The annual report of the Royal Edinburgh Mental Hospital for Mental and Nervous Disorders by Professor D K Henderson physician superintendent, shows that 1 131 patients were treated during 1936 in Craig House and West House of whom 378 were voluntary and 753 certified The number discharged recovered and relieved was 140 including 103 voluntary and thirty seven certified patients while the deaths numbered ninety three In Jordanburn Nerve Hospital for milder cases there were 270 admissions of whom 136 were discharged recovered and relieved, while four died At nursing homes connected with the institution there were 130 admissions of whom seventy three were discharged recovered and relieved and eighteen died An important aspect of the institution's work is the various out patient departments In this department of the Royal Infirmary 250 patients were examined and treated at the Jordanburn Nerve Hospital there were 285 out patients and at the University Psychological Clinic 212 In every department of the institution the numbers had greatly exceeded those for 1935 and were likely to go on increasing Jordanburn Nerve Hospital which attempted to deal with incipient cases of nervous or mental illness admitted patients whether they could afford to pay for treatment or not and had proved of great benefit this was an indication that further clinics of a similar kind were needed in other parts of Scotland The report points out that when the legal statutes governing mental treatment were enacted psychiatry was in its infancy with chaos and mismanagement in mental hospitals and safeguards were necessary, so that the liberty and safety of the subject should be preserved In Professor Henderson's opinion the time has passed for supervision and inspection of mental hospitals A Government inspection of mental hospitals is no more necessary than of hospitals for fever tuberculosis or other diseases At the present time the report states there are throughout the country nursing homes and clinics dealing with various forms of mental illness which function satisfactorily without control by crippling legislation and the extent to which they are used is the best proof of the confidence which the public places in them Mental illness is largely a preventive problem and in its incipiency should be dealt with in the free light of the community rather than behind closed doors In 1935 there were in Scotland about 24 000 certified patients under treatment not including the huge number of voluntary patients in mental hospitals and the public expenditure approached £1 250 000 annually yet much greater accommodation is required than is at present available Great advances have already been made in ante natal and infant welfare clinics improvements in housing and nutrition the school medical service and specialized clinics and hospitals to deal with the physical and mental needs of the child For the more adult population out patient departments have been set up in connexion with general and special hospitals All of these preventive agencies

understanding friend In him and around him was an atmosphere of kindliness such as is found in few men Though not above average height and build, Dr Wenyon's intellect, versatility, and quick yet kindly wit made him a dominant person in any company He leaves a widow and three sons and seven daughters

The death of HENRY CHARLES ROBERTS in his forty-fourth year (writes W G McA) has robbed our little corner of Cheshire, and indeed Merseyside of one whom to know was to love He graduated M B, Ch B in 1916 and served in Mesopotamia in the great war After practising for a short time in Liverpool he came over to Moreton in Cheshire He was a naturally gifted mechanic and early became interested in anæsthetics He designed and at first with his own hands made a portable gas oxygen ether apparatus a modification of what he thought best in the American Foregger and Heidbrink machines Latterly he had much improved this and when the Cunard White Star liner *Queen Mary* was being equipped his apparatus was installed in her To those of us his colleagues who were willing to learn he freely and generously gave of his special knowledge and made clearly plain what others seemed to have kept a mystery and this with undoubted financial loss to himself As anæsthetist to the Liverpool Dental Hospital I believe it is true to say that he revolutionized dental anæsthetics and his lectures with cinematograph films of dental anæsthesia were becoming increasingly sought after He was skilled in all forms of his art including evipan avertin ethylene, and cyclopropane and at the time of his passing was engaged on simplifying and making more economical the use of the last named He was an accomplished musician photographer, and a keen student of Nature delighting especially in his garden, and I shall always picture him coming to my poorly gardened house his arms filled with flowers His never failing cheerfulness generosity and unassuming kindliness had meant so much that his unexpected death has caused consternation to his professional colleagues friends and patients and among these latter the poor, who worshipped him He leaves a widow and one son

We regret to announce the death at sea on March 11 of Dr JOHN MCDONALD, who until his retirement practised for many years at Barking Essex He was born at Wishaw, Lanarkshire on July 4 1869 and from St John's Grammar School, Hamilton went to study medicine at Anderson's College and the University of Glasgow graduating M A in 1888 and M B C M with high commendation in 1892 Before settling in practice he was for a year assistant house physician at the General Hospital Nottingham Dr McDonald was appointed public vaccinator for the Barking district by the Romford Board of Guardians in 1902 and became certifying factory surgeon in 1906 He joined the British Medical Association in 1911 and was chairman of the Stratford Division in 1928–9

With the death on March 14, at his residence in Teddington of Dr FREDERICK WILLIAM ALEXANDER, O B E there has passed one of the health pioneers in the East of London whose services latterly to the blind were almost equally notable Born in Hatton Garden in 1859 he attended University College School and then went on as a medical student to St Bartholomew's Hospital He qualified M R C S Eng in 1881 and obtained the diploma L R C P Ed two years afterwards In 1887 he became D P H of the English Conjoint Board He held the post of deputy medical officer of the Croydon Union Infirmary contagious wards from 1881 to 1883, and then became a ship surgeon on the Dunkeld Currie Line He was resident assistant medical officer of the Mile End Old Town Infirmary in 1884–6 district medical officer and public vaccinator of the west district of Mile End Old Town from 1886 to 1893 and then medical officer of health for Poplar until 1926 In these capacities Dr Alexander brought into being many reforms in the sphere of public health being prominently associated with the chemical and electrolytic methods of purifying the water of swimming baths He published reports on the cause of diphtheria, the disinfection of houses the management of children, artificial light treatment the cause and prevention of malignant diseases and the nature of vitamins When he retired from his appointment in Poplar he championed the cause of the blind in the same practical way, devising an ingenious method whereby Braille reading could be more easily acquired by those who had lost their sight owing to accident or disease His leisure was mainly devoted to this and other ways of making life happier for the blind

I note with deep concern (writes Sir Ernest Graham-Little) the announcement in your issue of March 20 of the death of Lieut Colonel J R FORREST R A M C I first came into touch with him in the later years of his life when he decided to enter for the final medical examinations of London University sixteen years after he had retired from a long and distinguished service in the R A M C He took his M B B S Lond in 1927 when he was 71 years of age and the M D at the age of 75 surely a remarkable achievement worthy of notice After surmounting his final degree examination he wrote to me intimating his desire to serve the University in any capacity open to him and the General Purposes Committee took advantage of this offer and appointed him as a representative of the University on certain bodies in his own neighbourhood He was a constant attendant at meetings of Convocation up to a quite recent date It was a particular pride and pleasure to me that he gave me his vote in the Parliamentary elections of 1929 1931 and 1935 and I am glad to offer this tribute of gratitude to him and of regret for his loss

We regret to announce the death of Dr THOMAS GRIMSON of Boscombe at the early age of 45 on March 8 Dr Grimson graduated M B B Ch B A O at Queen's University Belfast in June 1914 and on the outbreak of the war joined up with the Ulster Division He saw service in France and two years later transferred to the Royal Navy where he held the rank of surgeon lieutenant till the end of the war After this he practised for a short period at Earlsfield But it was Finchley where he spent the greater part of his professional life and by his skill and winning personality built up a successful practice Three and a half years ago he left Finchley for Parkstone and only last August began practice afresh at Boscombe His popularity was demonstrated by the large number of former patients who attended the funeral at Finchley on March 12 This was preceded by a service on the previous day in St George's Methodist Church Boscombe conducted by the Rev James Mackay Among the large congregation attending this service was Dr Watson Smith vice president of the British Medical Association Dr Grimson leaves a widow and a son and daughter who have the sympathy of all his colleagues

The Services

The King has conferred the Efficiency Decoration of the Territorial Army on Lieut Colonels William Lawson Mabson Gabriel and Kenneth Pretty R A M C (T A) and Major and Brevet Lieut Colonel George Whittaker R A M C (T A)

NAVAL MEDICAL COMPASSIONATE FUND

A meeting of the subscribers to the Naval Medical Compassionate Fund will be held on April 16 at 3 p m at the Medical Department of the Navy Admiralty S W 1 to elect six directors of the Fund

could be more fully utilized if there was a co ordinated medical service Lunacy laws, however, smacking of superstition and witchcraft and totally out of keeping with present-day medical opinion still governed the mental health service but if a co ordinated scheme between the latter and the general health service could be brought to fruition it would do more to empty mental hospitals, prisons, and poorhouses than anything in the past The report also refers to the treatment of schizophrenia by hypoglycaemic shock induced by insulin Dr Pullar Strecker during the past year has treated a number of cases in this way, and it is evident that a certain amount of improvement occurred during the course of treatment but it is not yet possible to say whether the results are permanent The treatment consisted in producing a light or more severe coma by means of a graduated quantity of insulin, and the treatment was not altogether free from danger The average duration of treatment had been from six weeks to two months

Glasgow Mental Hospital

At the annual meeting of the Glasgow Royal Mental Hospital Dr Angus MacNiven, physician superintendent said that the mental illness in a considerable number of recent admissions appeared to have been largely due to unsuitable employment Economic and social conditions were not the most important factors in the causation of neuroses, even in cases in which external stresses appeared to have been the cause further investigation brought to light emotional difficulties of the individual which were of more fundamental importance Study had revealed that certain forms of employment and certain conditions of work were factors in the production of mental illness, and it seemed reasonable to suggest that steps should be taken to protect the mental health of those affected by these conditions in the same way as the physical health of workers was protected in some dangerous trades Legislation was required to control the adverse effect on mental health of certain types of employment in which the employee's income and security depended upon his producing a monthly or yearly progressive increase of business The report showed that the number of patients admitted during 1936 was 201 of whom 104 were voluntary patients The total number resident during the year was 736, and the average daily number 542 Sixty-five patients were discharged as recovered forty-three as relieved, and fifty-seven died The report also dealt with the work of the Lansdowne Clinic for Functional Nervous Disorders which was managed from the Mental Hospital This clinic had provided evidence of the importance of unemployment as a causative factor in psychoneurotic illness and male patients had been more numerous than female because unemployment was greater among men By the end of the year this clinic had been open for eight months and during that time 186 patients had been treated—106 men and eighty women—and the total number of consultations had been 654 Out of eighty seven cases in which treatment was finished forty-seven showed no improvement or the patient gave up attending, but in the remainder there was great improvement under treatment

---

An International Cremation Congress will be held in England from September 24 to October 2, 1937 All the cremation countries of the world have been invited to send delegates The working sessions of the congress, to be held in the Guildhall, London will occupy September 24 to 26 inclusive, and the remaining period will be spent by the foreign visitors and others who so desire in tours of the provinces where visits will be made to places of outstanding interest A number of social functions will be arranged for the delegates in London, open to members of the congress only Particulars may be had from the secretary-general, International Cremation Congress 23, Nottingham Place, London, W 1 The membership fee is £1 1s

Reports of Societies

NEUROLOGICAL SEQUELAE OF SPINAL ANAESTHESIA

At a meeting of the Section of Neurology of the Royal Society of Medicine on March 18, Dr ANTHONY FEILING in the chair, the subject of discussion was the neurological sequelae of spinal anaesthesia

Dr MACDONALD CRITCHLEY said that with few exceptions the literature on this subject was by non neurological writers and the problem was without exact data from the neurological point of view It was not even possible to say just how often neurological complications occurred, the figures available were contradictory Certainly a significant number of nervous sequelae were overlooked, especially ocular palsies and lesions of the cauda equina No scientific classification of the nervous sequelae was as yet possible, but he gave the following list

1 Headache severe and protracted, certainly the most frequent complication

2 Sixth nerve palsies and other cranial nerve affections These might include nystagmus, optic atrophy paralysis of the seventh eighth and ninth cranial nerves together and lesions of the trigeminal, auditory, and also the hypoglossal nerves

3 Lesions of the cauda equina and conus medullaris—quite common in his experience

4 Radiculomyelitis and myelitis In a small number of cases there was evidence of a widespread nerve process affecting a higher level He had no personal cases of transverse or ascending myelitis, but such cases were on record

5 Radiculitis

6 Focal cerebral lesions

7 Symptoms of latent neurological disease precipitated by spinal anaesthesia—for example, disseminated sclerosis, progressive muscular atrophy, and spinal syphilis

He also referred to the work of Spielmeyer Davis and others in the experimental production of spinal disease in dogs

It would be folly to ignore the accumulating evidence that spinal anaesthesia might at times be followed by neurological sequelae which, always disturbing in character, sometimes proved disastrous The most serious feature was that no steps could be taken to avoid these nervous after-effects for as yet their causation was unknown Were some or any of them attributable to faulty technique to errors in dosage to unsuitable pre-anaesthetic or post-anaesthetic medication or to nursing? How far was the drop in blood pressure a factor? What part was played by the anaesthetic substance itself? Were nervous sequelae commoner with one preparation than with another? Could it be that some or all of these nervous sequelae were due to the activation of a latent process by the lumbar puncture or the spinal anaesthetic? It was certainly time that neurologists exchanged their views

Anaesthetic Technique

DR J K HASLER said that the giving of a spinal anaesthetic demanded two manœuvres on the part of the anaesthetist first, a lumbar puncture must be performed and secondly, a drug must be introduced into the spinal canal Each of these actions demanded attention in considering possible sequelae He was convinced that the lumbar puncture itself was responsible for the majority of the troubles which followed spinal anaesthesia Headache, for example, was known to follow diagnostic lumbar puncture Points to consider were the size of the needle, with a finer needle the percentage of headaches was lower The needle used should be properly shaped any needle

Universities and Colleges

UNIVERSITY OF LONDON

APPOINTMENT OF PRINCIPAL

The Senate with the concurrence of the Court has appointed Mr Herbert Lightfoot Eason, C B C M G, M D, M S, F R C S, to the post of Principal of the University from July 1, 1937 to September 30, 1941

Mr Eason was educated at University College London and at Guy's Hospital He took his M D degree in 1901 and his M S in 1902 He has been superintendent of Guy's Hospital since 1920 having previously held the post of dean of the Medical School from 1904 to 1912 He has been a member of the Senate since 1911, and has been Vice Chancellor since 1935 He was chairman of the Library Committee from 1929 to 1933 chairman of the Finance Committee from 1923 to 1925 and chairman of the Academic Council for two periods (1922 and 1933) He served during the war as consulting ophthalmic surgeon to the Forces in the Mediterranean, Egypt and Palestine was mentioned in dispatches, and was awarded the G M C in 1917 and the C B in 1919 He has been the representative of the University on the General Medical Council since 1925 and is now Junior Treasurer of the Council From 1924 to 1926 he was a member of the Departmental Committee of the Board of Education on the reconstitution of the University of London and from 1925 to 1930 a member of the Departmental Committee of the Ministry of Health on Post graduate Medical Education

At a meeting of the Senate, held on March 17, with the Vice Chancellor Mr H L Eason, in the chair a message was received from the Chancellor the Earl of Athlone, that the Queen had been graciously pleased to signify her consent to receiving an honorary degree from the University of London The conferment of the degree will probably take place in the autumn

The degree of D Sc in Bacteriology was conferred on Miss M S Lacey of Birkbeck College

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL

Entrance Scholarships and Exhibitions

Two Goldsmid Entrance Scholarships, entitling the holder to the final course of medical study, are offered for competition in July, and are open to students who are preparing for the degrees of the Universities of London Oxford Cambridge, Durham or other British universities or for the diplomas of the Royal Colleges of Physicians and Surgeons also one Goldsmid Entrance Exhibition, entitling the holder to a reduction by £80 of the fees due for the full course of final medical study, and the Filliter Entrance Scholarship in Pathology entitling the holder to a reduction by £52 10s of the fees due for the full course of final medical study These scholarships and exhibition are tenable at University College Hospital Medical School Full particulars may be obtained from the secretary University College Hospital Medical School, University Street, W C 1

UNIVERSITY COLLEGE

The holders of the Bucknill Scholarship (value 160 guineas) tenable at University College for the intermediate medical studies and for the final course at University College Hospital Medical School are not eligible for the above awards The subjects of the examination are chemistry, physics botany and zoology and further particulars of this award may be obtained on application to the secretary University College Gower Street W C 1

UNIVERSITY OF LEEDS

Dr W MacAdam, F R C P, formerly professor of clinical medicine has been elected to the chair of medicine in place of Dr G W Watson F R C P and Dr J le F C Burrow, I R C P formerly professor of pharmacology and therapeutics has been elected to the chair of clinical medicine To the vacancy caused by these changes the Council has elected Dr S J Hartfall M R C P, with the title of professor of therapeutics and applied pharmacology

At a meeting of the University Council held on March 17, Miss M Hilary E Long F R C S, was elected to the newly instituted readership in surgery, and Dr J C Coates was appointed demonstrator in anatomy

UNIVERSITY OF DUBLIN

It is proposed to confer on June 30 the honorary degree of Doctor of Science on Professor J S B Stopford M D, F R S, Vice Chancellor of the University of Manchester

Medical Notes in Parliament

The Public Health (Drainage of Trade Premises) Bill passed through committee in the House of Lords on March 16 and was set down for second reading on March 22 The Deaf Children (School Attendance) Bill was read a second time in the House of Lords on March 18 On March 19 the Royal Assent was given to the Regency Act, the Geneva Covenant Act, and the Evesham and Pershore Joint Hospital District Act

Before adjourning for the Easter Recess the House of Commons this week discussed the Air Estimates the floods in the Fens, and the import duty on steel When Mr Baldwin moved and the House agreed, on March 17 that a Select Committee of the House of Commons be set up to consider the Civil List, Sir Arnold Wilson asked whether the committee would be free to consider the adequacy of "Civil List" pensions although these were not actually borne on the Civil List The annual new money provided in these for persons who had made useful discoveries in science or performed other duties to the public had not changed since 1837 Mr Baldwin said the Government had no objection to this matter going before the Select Committee

Dr Kurt Hahn of Gordonstown School, Elgin, who previously established Salem School on Lake Constance, addressed the Health and Housing Committee of Conservative Members at the House of Commons on March 17 He said it was found that boys in other schools were over-exercised and their hearts sometimes damaged Each boy's efficiency should always be tested first and physical training was useless except under proper health supervision Three medical examinations a term were needed, and the institution of a badge for proficiency in jumping running, and throwing was invaluable Crack athletes produced on the ordinary system were usually failures in patience and in enterprise Sir Francis Fremantle presided

The House of Commons will reassemble on April 6 and the Budget will be opened on April 20

Factories Bill in Committee

When the Standing Committee of the House of Commons which is examining the Factories Bill resumed on March 16 Clause 15 (provisions as to unfenced machinery) and Clause 16 (construction and maintenance of fencing) were agreed to Amendments were made to Clause 17 (new machinery) and the clause was added to the Bill

On Clause 18 (vessels containing dangerous liquids) Mr GRAHAM WHITE moved to add a provision that every vessel sump, or pit covered by this section should have affixed to it a notice indicating the nature of its contents Mr BROAD pointed out that the clause only dealt with fixed vessels More accidents occurred with the use of portable vessels of earthenware or of lead and from the huge carboys in which acid was stored Mr BANFIELD said that in Birmingham he had seen these portable vessels treated in an irresponsible way and carried through the streets on all sorts of vehicles Sir JOHN SIMON said that it was possible under Clause 58 to make a regulation directing that carboys containing dangerous things should not be left lying about, but be put in proper places The committee agreed to the clause and also to Clause 19 (self acting machines)

ACCIDENTS FROM MOVING MACHINERY

On Clause 20 (cleaning of machinery by women and young persons) Mr MANDER moved an amendment which provided that instead of the prohibition against the cleaning of prime movers or transmission machinery in motion applying only to women and young persons it would apply against all persons

with a blunt point should be discarded He preferred to make his injection in the middle line instead of from one side In the prevention and treatment of headache it was usual to keep the patient in the Trendelenburg position when returned to bed A second complication of lumbar puncture was gross damage to the nervous tissue by the needle if the technique was imperfect It occasionally happened when making a puncture that the patient felt a shooting pain down the hip it was transitory but it did not occur if the needle was kept strictly in the mid line The third complication was haemorrhage However carefully the puncture was made there always seemed to be cases in which a blood vessel was injured Was this likely to produce a haematoma with pressure effects? Turning to the question of the drug injected Dr Hasler pointed out that the most efficient anaesthetics were the most toxic In the early days the commonest drug used was stovaine, and some cases of stovaine tabes occurred but these were not referred to in later work and possibly were due to faulty technique The concentration of the drug was important If a drug was used in a dilute form and had the effect of temporarily paralysing the nerve, the same drug used in greater concentration might easily turn the temporary paralysis into a permanent one

Experimental and Pharmacological Considerations

Professor A D MACDONALD said that the introduction of a solution of local anaesthetic into the cerebro spinal fluid in the lumbar region was easy in the cat and dog The dilution of the injection had been followed for drugs of the procaine series by collecting small samples of cerebro spinal fluid at intervals and estimating the concentration of drug colorimetrically The absorption into the blood stream the partial excretion in the urine and the spread from the lumbar region to the cervical region and cisterna magna had also been followed Provided the volume injected was not excessive such spread was surprisingly limited, and within limits the volume of the solution was a more important factor than the weight of drug injected in avoiding acute catastrophes The concentration found in the blood was never significant confirming the experimental and clinical evidence of the absence of danger on absorption as compared with the risk of spread to the phrenic roots or the vital centres or both

The incidence of sequelae had been investigated in the cat in which animal they were recognized by tail droop symptoms referable to bladder and rectum and sensory changes using simple solutions of procaine hydrochloride and various proprietary solutions Doses considerably in excess of the weight for weight clinical doses had to be used to get symptoms The common constituents of solutions other than the drug—ethyl alcohol, glycerin glucose, etc—could be exonerated Amylocaine (stovaine) appeared to be quite as likely as procaine to provoke sequelae That the local anaesthetic drug rather than the needle was responsible for the sequelae was clear from the diffuse nature of the symptoms Further evidence had been obtained by investigating the frequency of disturbances after the administration of 2½ 5 10 and 20 per cent solutions The proportion of affected cats increased with the concentration of the drug injected

Points in Aetiology

Dr FERGUS R FERGUSON described a series of thirteen cases with the neurological picture of a cauda equina lesion These cases occurred in the eighteen months period between August 1933 and March 1935 and followed heavy durocaine spinal anaesthesia It was remarkable that such a number should have occurred within a short time, because a search of the literature had revealed only about sixteen similar cases The ages of the patients ranged from 17 to 70 eleven of them were males and two females Of the operations, eight were operations of urgency The anaesthetic was heavy durocaine in all cases except one The complications were severe in eight and mild in five There were three deaths in this series but none of them could be attributed directly to the spinal anaesthetic Broadly the neurological complications were absence of one or more of the leg tendon reflexes retention of urine, incontinence of faeces sensory loss in the sacral region, and loss of sexual function During the period under review about 1 000 heavy durocaine spinal anaesthesias were given and about 1 000 stovaine but the only complications were in these thirteen Discussing some aetiological points, he said that he could not agree that any significant part was played by trauma A novocain compound seemed to be suggested as the toxic agent but why this large incidence after heavy durocaine? The possibility of the constituents of the solution other than the drug being incriminated had been considered alcohol was viewed with some suspicion, but it scarcely seemed possible that the lesion could be due either to alcohol or to the glycerin He suggested as the cause of this heavy incidence with durocaine that it was due to a combination of the drug with the alcohol and the glycerin leading to the undiluted procaine being too long locally in contact with the nerves it did not diffuse rapidly enough

Clinical and Pathological Experiences

Dr W RUSSELL BRAIN said that he had seen certain cases of cranial nerve palsies in which both the sixth both the seventh and both the eighth nerves were affected, but the patients recovered completely in about two weeks He proceeded to give the clinical details of a case of neurological sequelae following spinocain The chief point about it was the long latent interval before the neurological symptoms occurred Pain was not felt until a week after the anaesthetic and motor symptoms were not experienced until a month In most of such cases he believed the paralysis had followed in the course of two or three days The interval might have been an incubation period for a process of sensitization and in these days the possibility of superimposed virus infection must be mentioned This case had a fatal termination and Dr DOROTHY RUSSELL gave an account of the pathological findings There was softening in the lower thoracic and upper lumbar segments The characteristic finding was the necrosis of the whole substance of the cord in the lumbar region complete in the grey matter and incomplete in the white There was no evidence of direct trauma to the cord or of old haemorrhage nor was there any evidence of the introduction of any infective agent at the time of puncture

Dr H K ASHWORTH said that the cauda equina lesions should be regarded as a dangerous group Another dangerous category included patients who had an incipient disease of the nervous system which was precipitated into activity by the administration of the spinal anaesthetic Of the more transient lesions headache was much the commonest sequel This occurred often in a severe form after diagnostic lumbar puncture so that it was not the result of the drug A German worker had published a paper based on an experience of many hundreds of spinal anaesthesias and found no difference at all in the incidence of headache following the use of different sizes of needles but he had found the incidence of headache to vary according to the age group, being more severe in younger and more highly strung persons Patients who had been given spinal anaesthetics without their knowledge after premedication also developed headaches, so that the condition was not always a functional one The German worker had advocated nitroglycerin as a remedy, but in the speaker's hands it had not been successful

Dr WILFRED HARRIS said that he had been accustomed to inject novocain in the sciatic nerve and no permanent symptom whatever had resulted He could not accept what had been said about the possibility of a direct effect of concentrated novocain He suggested that the cause of the sacral lesions was the very strong vasoconstrictor effect Dr J P MARTIN mentioned a case of ascending

Mr SHORT said the Labour Opposition was not satisfied with the clause as it was drafted and hoped the Home Secretary would accept Mr Mander's amendment Accidents among young persons had greatly increased The Chief Inspector of Factories and Workshops had called attention to this matter In 1935 there were 25 042 accidents among young persons or 3 130 accidents per 100 000 young persons employed as compared with 2 542 accidents per 100 000 employed among adults

Sir JOHN SIMON said he could not accept the suggestion that nobody—man woman, or young person—should clean any part of a prime mover or transmission machinery while it was in motion How were engines to be cleaned in a power station, where they never stopped? Statistics showed that both women and young persons if they cleaned machinery were subjected proportionately to far more accidents than other people whether in textile factories or non textile factories

Miss HORSBURGH asked whether statistics for accidents to women and young persons were kept separately

Sir JOHN SIMON said the figures had been taken out separately Women probably did more cleaning than men but the age of women in factories was on the average lower than that of men They were people short of experience and might sometimes be a little casual In the cotton industry cleaning accidents to men were 45 6 per 100 000 and cleaning accidents to women 101 7 per 100 000 The cleaning accidents to young persons were 166 8 per 100 000

Mr Mander withdrew his amendment and the clause was added to the Bill

SAFETY DEVICES ON LIFTS

A discussion followed on Clause 21 (hoists and lifts) Mr BROOKE moved to omit certain words and explained that the effect of the omission would be to enforce the provision on every hoist or lift of a device automatically fastening the gateway Mr GEOFFREY LLOYD said the only provision in the existing law was that lifts and hoists should be securely fenced The clause would involve considerable expense to occupiers but there was no general opposition to it It was not true that all existing hoists could easily be adapted with the device of interlocking gates All that the clauses provided was that these interlocking devices should not be obligatory on existing hoists where the difficulties would be great The amendment was defeated by 20 to 18 and the committee adjourned until March 18

On resumption the committee accepted an amendment to Clause 21 which was moved by Sir JOHN SIMON and dealt with the provision of safety gates to lifts Other amendments were made and the clause was added to the Bill Sir John Simon explained that lattice gates to lifts were not to be prohibited although it was desirable that the interstices should not be so wide as to catch a man's foot or heel They could not prevent the small extremities running a little risk

OTHER SAFETY CLAUSES

Clause 22 (chains ropes and lifting tackle) Clause 23 (cranes and other lifting machines) and Clause 24 (construction and maintenance of passages and stairs) were added to the Bill To the last clause the committee added on the motion of Sir John Simon a proviso that any open side of a staircase shall also be guarded by the provision and maintenance of a lower rail or other effective means Clause 25 (safe means of access and safe place of employment) was approved with modification reducing from 12 to 10 feet the height of working places which must be secured by fencing unless they afford secure foothold and handhold

On Clause 26 (precautions in places where dangerous fumes are liable to be present) Mr GEOFFREY LLOYD promised before the report stage to investigate the objection made by Mr Silkin Mr Frankel and Mr Gibbins that the safeguards proposed were insufficient These members object in particular that where a man was working thirty or forty feet away from a manhole and might create fumes by his work—as for instance by using an oxy-acetylene burner—the provision of a belt and a rope the free end of which was held by a person outside was not sufficient safeguard Mr GIBBINS said that when men were working below the boilers or engines of a ship all day without gas masks their chests became affected from the fumes On Mr Lloyd's undertaking the clause with certain amendments was ordered to stand part of the Bill

On Clause 27 (precautions with respect to explosive or inflammable dust gas vapour or substance) an amendment was accepted in the name of Mr Graham White providing that the Chief Inspector could grant exemption from compliance with any of the requirements of the subsection when satisfied such compliance was unnecessary or impracticable and also that the sub section should not apply to plant installed in the open air He explained that this particularly applied to work upon gas holes The committee then agreed to the clause Subsequent clauses dealing with steam boilers steam receivers steam containers and air receivers were added to the Bill as was also Clause 32 dealing with water sealed gas holders A discussion followed on Clause 33 (means of escape in case of fire) which together with Clause 34 (regulations and by laws as to means of escape in case of fire) Clause 35 (safety provisions in case of fire) and Clause 36 (instruction as to use of means of escape in case of fire) were added to the Bill

A discussion on Clause 37 (power of the Secretary of State to require special provision in cases of special danger) was begun and the committee adjourned until March 23

Army Life to be Improved

Introducing the Army Estimates on March 16 Mr DUFF COOPER said reforms would be made in Army life which would increase the popularity of the service The soldier's ration was to be increased to allow of four meals a day instead of three At home stations an ounce of butter would be substituted for an ounce of margarine and the butter would be supplemented by half an ounce of irradiated margarine The daily ration of enlisted boys would be increased by an issue of milk or in other suitable ways It had also been arranged that men living in married quarters or unable for other reason to feed in mess should receive a sufficient allowance of food or money to ensure that they would enjoy the same scale of nourishment as their fellow soldiers Every effort was being made to improve the conditions of accommodation New barracks would include sleeping dining and ablution facilities Sitting rooms would be provided hot and cold water laid on to every floor central heating throughout and arrangements were being made for increases in fuel scales So far as possible similar amenities were being extended to existing barracks and married quarters were being brought up to the best housing standards of the day

Research on Influenza

In a reply to Mr Lees Jones on March 18 Mr RAMSAY MACDONALD said research on influenza and the common cold had been assisted by the Medical Research Council from time to time In particular the investigations into influenza now being made by the Council's own staff at the National Institute for Medical Research had been in progress since 1933 During the past year there had been further confirmation from different parts of the world that the virus originally isolated at the National Institute for Medical Research in 1933 was the infective agent which caused epidemic influenza On this basis attempts to devise preventive measures continued Substantial progress had been achieved by these scientists working in the service of the British Government and there was considerable ground for hoping that a satisfactory means of producing at least temporary immunity would be evolved Earlier methods of inoculation against influenza had been unsatisfactory because they were not based on the accurate knowledge now believed to be available regarding the nature of the causative agent The Council was not at the moment supporting any direct attack upon the common cold but the

myelitis following a spinal anaesthetic The patient first of all had symptoms of the usual sacral group and then numbness spreading upwards, and when he saw him about a week after the anaesthetic he had symptoms of high spinal lesion About a day or two later he developed hemiplegia down one side and eventually down the other, and died Dr FEILING from the chair, in closing the meeting mentioned certain cases recorded in literature one of persistent paraplegia, by Dr Langton Hewer, and two cases of temporary mania, by Mr Dickson Wright, percaine being the anaesthetic used in all cases

GASTRITIS

At a joint meeting of the Liverpool Medical Institution and the Manchester Medical Society at Liverpool on March 4, with Professor R E KELLY in the chair, Mr R L HOLT read a paper on gastritis

Mr Holt said that for the past eighteen months he had been collecting fresh specimens of stomach following partial gastrectomy for chronic gastric ulcer His histological findings had been substantially the same as those described by Konjetzny, Kalima, and Puhl differing simply in degree, a change readily explainable on the difference in the pre-operative treatment existing in this country and in Continental clinics In more than half his cases there had been naked-eye evidence of a subacute gastritis which was most marked in the pyloric antrum but extended to a lesser degree into the duodenum and body of the stomach On microscopical examination all his specimens had shown evidence of a subacute or chronic gastritis The histological changes were distributed in a patchy fashion throughout the gastric mucosa, erosions alternating with areas of normal mucosa, hypertrophy, and atrophy He suggested that in this country there was a tendency to stress the importance of the presence of a definite peptic ulcer and to neglect the larger number of cases which had all the signs and symptoms of peptic ulceration except x-ray evidence of an ulcer There was no doubt that all the signs and symptoms usually associated with chronic peptic ulcer could be reproduced by a pyloric gastritis, and he quoted Faber, who had stated that the signs and symptoms were produced by the gastritis and not by the ulcer He discussed the factors generally deemed of importance in the genesis of chronic gastric ulcer and stated that in his view chronic ulcer might well be considered as a complication occurring in a case of pyloric gastritis Most patients who consulted their practitioners on account of gastro intestinal disturbances were still classified non committally as dyspepsia of one sort or another He hoped that the recognition of the frequent occurrence of gastritis and the signs and symptoms which it produced would prove to be a great step forward in penetrating this diagnostic fog

Professor HENRY COHEN referring to a query by the President "What is indigestion?" feared that if certain current Continental ideas on gastritis were accepted the impetuous surgeon would not stay for an answer but would proceed to partial gastrectomy Such mutilation was, in his view quite unjustifiable in the present knowledge of the subject The condition of chronic hypertrophic gastritis had yet to be defined with much greater care, as also had the factors which played a part in its production and its relationship to gastric ulceration It had been stated that gastritis almost invariably preceded ulceration and cancer of the stomach, but Church, Walters, and Wellbrock of the Mayo Clinic had shown that pyloric obstruction itself was a very important factor in producing gastritis, which was practically absent in cases of carcinoma of the stomach without pyloric obstruction but was present in eleven out of twelve cases with pyloric obstruction Many exogenous factors could cause inflammatory changes in the gastric mucosa—mechanical chemical, thermal, and bacterial Professor Cohen recalled that after Alexis St Martin had been drinking "ardent spirits" for nearly a fortnight, Beaumont found characteristic changes of gastritis, including erosions Atrophic gastritis with achlorhydria had been studied in much greater detail Its association with hyper- and hypochromic anaemias, subacute combined degeneration of the spinal cord, certain types of polyneuritis, and steatorrhoea had been firmly established

Mr J HOWELL HUGHES said that gastroscopy had revealed three types of gastritis (1) the catarrhal, which showed change of colour of the mucous membrane from the normal orange to a deep red colour, often with submucous haemorrhages, (2) the atrophic, pale flat mucous membrane usually seen in anaemias, and (3) the hypertrophic type, the pathological changes in which Mr Holt had discussed Similar changes were seen in gastroscopy —namely tortuous and redundant rugae small granulations on the rugae, sometimes small varicosities and in some cases small acute erosions In this type a certain rigidity of the mucous membrane was obtained so that rugae which normally flattened with air distension were still present, and therefore it seemed as if a permanent change in the mucous membrane had taken place

Mr JOHN MORLEY said that while it had been certainly proved that gastritis could be found in the mucosa surrounding gastric and duodenal ulcers in a large proportion of cases, there was insufficient evidence to determine whether this condition was a predisposing cause or a result of the ulceration Where pyloric gastritis was present without gross ulceration it was impossible to detect it without opening the stomach (apart from previous gastroscopy), he felt some misgivings that if ever such an intangible lesion came to be regarded as an indication for partial gastrectomy a very valuable operation might fall into disrepute With regard to the atrophic gastritis associated with achlorhydria the difficulty was that the condition was very common and increasingly so with advancing age and as a rule gave rise to no dyspeptic symptoms The claim sometimes made that atrophic gastritis was a common predisposing cause of cancer was entirely unproved

EMOTION IN CHILDHOOD

At a meeting of the Medical Society of Individual Psychology on March 11 a paper was read by Dr MARGARET LOWENFELD on the toddler and school child

Dr Lowenfeld said that with so wide a subject before her she was not attempting to deal with any of the detailed problems that arose during this long period of years but was instead going to make an attempt to touch upon certain basic principles of mental hygiene which were with modifications to be found in operation over the whole period of childhood She first mentioned emotion in childhood, which differed from emotion as experienced by the average adult in three ways The adult was accustomed to say "I am happy I am sad," thereby exhibiting the fact that together with the emotion there was the consciousness of the self as experiencing the emotion Only in panic that overwhelming rage admitted as a defence by the French legal code in the *crime passionnel* and in sexual experience did this not hold true for adult life in these situations the "I" became blotted out by the emotion Children particularly very young children, found themselves constantly in this situation, for there was as yet no consciousness of a separate "I" The child in a rage to be rightly understood must be regarded as "a piece of rage" In the second place the adult in stating 'I am happy" at the same time implicitly affirmed his awareness of the fact that there had been moments before and would be moments again of which this could not truly be said, his statement contained an awareness of time Emotion in the child on the contrary was timeless, and while it persisted appeared to the child eternal Finally, there were very few adult emotional states in

problems were closely related, and an advance against the one disease was likely to assist attack on the other A statement which had been made in the Press to the effect that the Council had as a matter of policy abandoned work on the common cold was without foundation It was not possible to state the cost of this investigation separately from that of other work involving the same personnel and equipment

Birching of Juveniles Committee of Inquiry

SIR JOHN SIMON said on March 18 that there were 164 cases of birching ordered in juvenile courts in 1936 and 218 cases in 1935 The practice of different juvenile courts differed, and he had decided to appoint a small Departmental Committee to consider the whole matter

Capitation Fee Tribunal

On March 22 MR RHYS DAVIES asked the Minister of Health whether he was in a position to state the personnel and terms of reference of the tribunal to be set up to inquire and report on the capitation fee to panel practitioners under the national health insurance scheme SIR KINGSLEY WOOD replied that he was in communication with the British Medical Association on these matters, but was not yet in a position to give the information desired

Typhoid Fever Outbreak at Liverpool—SIR KINGSLEY WOOD on March 17 assented to a statement that the milk supply obtained from the same retailer by some 60 per cent of the persons affected in the recent outbreak of typhoid fever at Liverpool was pasteurized milk He added that there was no reason to believe that milk was the source of infection in these cases

Sale of Spectacles—SIR KINGSLEY WOOD on March 18 told Mr Robert Taylor that he had no direct evidence of damage caused by wearing of spectacles sold by certain stores and by pedlars with no qualifications as opticians, and had no power to prohibit their sale So far as insured persons are concerned it was proposed to make regulations that spectacles provided by way of additional benefit could only be obtained from opticians recognized by a committee to be set up under the regulations

Death following Vaccination—SIR KINGSLEY WOOD stated on March 18 that he had made inquiries into the death of a man at Manor Park which was attributed by the Ilford coroner to the effects of vaccination The lymph used was obtained from a commercial firm and rabbits were not used in connexion with its manufacture He had no information on the allegation that the young man's employers made vaccination a condition of employment

Filter Material in Gas Masks—MR GEOFFREY LLOYD told Mr Creech Jones on March 19 that the material employed as a filter for smokes in the gas masks being made at Blackburn for distribution to the civilian population consisted of a mixture of wool and asbestos Extensive tests with toxic smokes had proved that the respirator would afford protection against all such poison gases under the conditions which would arise in practice

Transfusion of Corpse Blood—SIR KINGSLEY WOOD replying on March 22 to Mr M Samuel, said that he had no information of experiments in the transfusion of blood from the dead in this country No legislation to limit transfusions to those from living persons who willingly offered their own blood was called for

Extension of Contributory Pensions Scheme—In the House of Commons on March 22 SIR KINGSLEY WOOD presented the Widows, Orphans', and Old Age Contributory Pensions (Voluntary Contributors) Bill The measure extends the classes of persons who can become insured as voluntary contributors for the purposes of widows', orphans', and old age contributory pensions, and amends, in relation to voluntary contributors and women engaged in certain excepted employments the enactments relating to such pensions and health insurance

Medical News

A Chadwick Public Lecture on "The Plan and Equipment of Kitchen Offices in Hospitals and other Institutions" will be delivered by Miss R Whitaker at the Royal Sanitary Institute, 90, Buckingham Palace Road, S W, on Thursday, April 15, at 5 30 p m

As part of the first national appeal of the People's League of Health a festival banquet will be held at the Guildhall, London, on Thursday, April 15, at 7 45 p m The Lord Mayor will preside, attended by the Sheriffs of the City of London

A meeting of the Cambridge Medical Society will be held at Addenbrooke's Hospital on Friday, April 2, at 2 30 p m, when a discussion on "Joints from the Medical Point of View" will be opened by Dr J F Gaskell and Dr W H Bradley Members of the Cambridge and Huntingdon Branch of the British Medical Association are entitled to attend the meetings of the society

The Swiss Society for Internal Medicine will hold its annual meeting at Geneva on June 5 and 6, when the chief subjects for discussion will be angina pectoris and its treatment, introduced by W Frey of Berne, and hypochloraemia, introduced by R Mach of Geneva Further particulars can be obtained from Professor G Bickel, 2, Rue Saint-Legier, Geneva

The German Society for Historical and Social Medicine will hold its twenty sixth congress at Breslau from May 12 to 14, the subject for discussion being the present state of our knowledge on electropathology Further information can be obtained from Professor Schrader, Lahnstr 9, Marburg a d Lahn, Germany

An international congress on haematology, organized by the German Haematological Society, will be held first at Munster and then at Bad Pyrmont, Germany from May 8 to 14 Further information can be obtained from the general secretary, Dr Rosegger, Med Universitats Klinik, Westring 2, Munster, Westphalia

The fifth International Hospital Congress will be held in Paris from July 5 to 11 inclusive Among the items on the programme are a lecture by Professor Roussy Paris, on "The Care of the Cancer Patient in the Hospital", a discussion at the plenary session, on July 7, on "How Can the Hospital Increase its Income and Reduce its Expenditure without Detriment to its Work?", a discussion, on July 9, on "The Methodical Organization of Hospital Services," one of the speakers being Mr H L Eason, vice chancellor of the University of London, and a discussion, on July 10, on "The Rights of the Hospital in Regard to Documents Drawn up for the Service of the Patient (films, graphs, etc)' Full particulars of the congress and of the study tours and sight seeing arranged in connexion with it may be obtained from the general secretary and treasurer, International Hospital Association, 87, Lord Street, Liverpool

The result of the Parliamentary by election in the combined English Universities constituency, caused by the death of Sir Reginald Craddock, was declared at Birmingham on March 22 Mr T E Harvey, formerly a Liberal M P and standing now as an Independent Progressive, polled 6,596 votes, Sir Francis Lindley (Conservative), 4,952, and Sir Henry Brackenbury (Independent), 2,373

On the afternoon of March 18 members of the University of London Medical Graduates' Society paid a visit to the Charterhouse and the Medical College of St Bartholomew's Hospital in Charterhouse Square, where they were received by Mr W Girling Ball F R C S, dean of the Faculty of Medicine of the University and dean of St Bartholomew's Medical College

which the telephone bell went unanswered There was always a part of the adult's personality, whether he was aware of it or not ready to respond appropriately to habitual external stimuli This also was not true for a child There was no part of a young child able to respond to external stimuli while the rest of the child was swamped by emotion

Indestructibility of Emotional Force

Another basic principle Dr Lowenfeld said was the indestructibility in human beings of emotional force once aroused She likened this to the law of the preservation of energy A total physical organism was like a balance sheet if the emotion generated could not immediately be seen in outward manifestation it was none the less present but its presence would be shown by evidence of conflict expressed in one of four ways—physical illness educational failure personality deviation or delinquency Dr Lowenfeld then went on to emphasize the importance of language in the emotional development of the child According to modern psychological findings it was probable that some sort of mental activity was present from the first day of life The central difference between mental work carried out now and later in life was that lacking both language and the ability to move about under his own steam and check up his findings by reality these mental structures built up by the child had perforce to be entirely subjective and based wholly upon subjective data Being moreover, untestable by the child they had that obviousness and self evidence that all self consistent theories have for the individual who makes them

The watershed for mental and emotional health came between 8 and 11 years when the child for the first time began to manipulate speech, not as a practical tool as the monkey uses the stick to procure for himself the banana skin but as a medium for the expression of thought Upon a child's reaction to this situation the speaker believed that the general character of a child's later development depended Several typical contrasting reactions were described and the help that can be given to a child at this stage was outlined

Dr Lowenfeld then went on to consider the question of emotion in itself and declared her belief that emotion like the other two aspects of organic human life the physical and intellectual had a morphology of its own that it could and should pass through certain definite stages in its progress to maturity Some of these stages were touched upon and it was pointed out that for proper development at each stage certain elements in the environment were essential These elements were difficult to obtain or were actually missing altogether from many city children's environments She held that it should be the set aim of much of education artificially to supply what civilization had removed and drew attention to the heartening success of several experiments in this direction in certain L C C infant schools She pointed out that if this scaffolding for growth were lacking emotion remained at a more backward stage than the intellectual development of the individual, and tended to express itself as illness psychoneurosis, or delinquency Cases were described in illustration of children showing these complaints and indicating how analysis of the case from this point of view and treatment on these assumptions resulted in reorientation of the individual to life with consequent gain in health, and emotional and mental vigour

Finally as a special illustration of the above principle practitioners were warned to use caution in accepting the label general debility and advised instead when all causes of organic disease had been carefully eliminated to look for a persistent emotional maladjustment of an obscure nature as a cause of the persistence of chronic ill health The child's view of many necessary and routine medical procedures as an attack upon his own weakness was described and ways suggested of getting round this difficulty The general importance of not overlooking the emotional aspect of disease in childhood was stressed

PATHOLOGY OF ARTERIAL THROMBOSIS

At a meeting of the Pathological Society of Manchester on March 10 with Dr T H OLIVER the president in the chair Professor E D TELFORD delivered an address on The Pathology of Arterial Thrombosis

Professor Telford excluded from his review those cases in which thrombosis followed injury or embolism and confined his remarks to thrombosis consequent on disease of the arterial wall Although thrombosis was of great clinical importance and often contributed to the final catastrophe, it was from the pathologist's standpoint merely an incident supervening after months or years of alteration in the vessel walls It was possible on clinical grounds to establish a rough division of arterial disease into spastic and toxic The chief members of the spastic group—the vascular complications of cervical rib and the Raynaud phenomenon—were responsible for thrombosis by causing damage to the arterial wall through compression and spasm of the vasa vasorum Sections of arteries and arteriographs were shown in support of this view

In regard to the toxic group the speaker devoted some time to an account of the various theories advanced to explain thrombo angiitis obliterans He discussed more particularly the possible occurrence of this disease in horses and laid some stress on the resemblance of the clinical findings in thrombo angiitis obliterans to those described in epidemics of gangrenous ergotism For arteriosclerosis the term atherosclerosis was considered preferable since the latter not only implied that the condition was compounded of two pathological processes—atheroma and sclerosis—but also covered the occurrence of the lesion in veins instances of which were shown on the screen Professor Telford concluded by the observation that defects of nutrition of the medial coat by spasm or obliterative disease of the vasa vasorum might supply a clue to the medial calcification

Correspondence

The Case for Pasteurization

SIR,—It was with much interest that I read of the Poole Corporation Bill which seeks to provide among other things for the compulsory pasteurization of milk for human consumption (*Journal* March 13 p 571) The Corporation of Poole and their medical officer of health Dr R J Maule Horne are to be congratulated for their progressive outlook in seeking legislation on this important subject Those of us who realize the great benefits which can accrue from efficient pasteurization will hope that their endeavours may meet with success They have certainly chosen a propitious moment in which to put forward their claims to be rid of the raw milk menace to the public health within the confines of their borough

In submitting the case for pasteurization it is to be hoped that mechanical bottling will also be given consideration as being a most important and necessary factor in avoiding a possible subsequent infection of the milk During the Chelmsford outbreak of milk borne scarlet fever in August to September 1935 an examination of throat swabs from employees at the dairy distributing the infected milk revealed that eight out of seventeen of the employees were themselves infected with *Streptococcus pyogenes* type II this being the organism which caused the outbreak Although the originating source of the infection was proved to be a milker at a certain farm supplying milk to the dairy it is quite probable that some additional infection had been occurring through the medium of these infected employees prior to their detection Therefore it may well be appreciated that

The prize for the essay on the Significance of Heredity in Ophthalmology,' sent in for the Gifford Edmonds Prize has been awarded to J Bruce Hamilton M B Ch M Sydney D O M S Lond, D O Oxon, I R A C S, of Hobart, Tasmania

A gold medal is awarded annually by the Hunterian Society for the best essay written by a registered general practitioner resident within the British Empire on a subject set by the society The subject for 1937 is The Prognosis and Care of Heart Disease in General Practice and for 1938 The Management of Inoperable Malignant Disease in General Practice Candidates should obtain a copy of the rules governing the competition from the honorary secretary Mr Arthur Porritt 27 Harley Street W 1 before sending in their essays which must reach him by December 31 The gold medal for 1936 was awarded to Dr L J A Pirr of Sydney, Australia, for his essay on Rheumatoid Arthritis

In the autumn of 1935 Lord Nuffield offered to give to Papworth Village Settlement a sum of £25 000 when the settlement had itself raised £75 000 Papworth has now managed to raise £60 000 of the total needed and on Tuesday, April 20 at Grosvenor House the Duke of Kent will preside over a festival dinner by means of which it is hoped to raise the final sum needed to render Lord Nuffield's offer effective A film will be shown and dancing and a first class cabaret will follow the dinner Tickets may be had from Papworth's new London offices at 16 Grosvenor Place, S W 1

The annual dinner of the Medical Superintendents Society was held at the Langham Hotel on March 20 with the president Dr John D Ewart in the chair The toast of The Society was proposed in a brief speech by Sir Cuthbert Wallace, who remarked that his medical life corresponded with that of the society Referring to the development of hospitals during this period he said that in his student days the steward ruled the hospital In these days hospital life was so complex that the existence of such a society as the Medical Superintendents was essential Maintaining the excellent standard of brevity that had been set by Sir Cuthbert Dr D Ewart in reply recalled some of his early experiences in hospital life and said that he remembered the installation of the first x ray plant and of the first pathological department in the hospital at which he worked The medical superintendent he said was a co ordinating power and the society showed signs of great activity The health of the guests was proposed in a witty speech by Dr W A Ramsay who with appropriate annotation welcomed the presence of Sir Cuthbert Wallace Dr Adolphe Abrahams Dr Ernest Ward Mr G A Elliston representatives from the *Lancet* and the *British Medical Journal* Dr Mackintosh and Dr H P Newsholme Replying for the guests Dr Abrahams gave a short dissertation on the custom of after dinner speaking remarking that man was the only animal which indulged in this—other animals lay down and went to sleep Speaking not only as a guest but also as a representative of the voluntary hospital he said that the time would surely come when all the resources of the voluntary and municipal hospitals must be pooled Dr Ernest Ward who sustained the level of wit with ornithological anecdotes also replied for the guests

Miss Ada Blanche Marshall daughter of the late Professor John Marshall F R C S left estate valued at more than £32 000 Among other bequests she gave £2 000 to Epsom College half to be applied towards the cost of pensioners and half towards the cost of foundation scholars in memory of her father The bulk of the residue of her estate is bequeathed to the University of London to be applied for the advancement of surgery in the name of her father

The Meteorological Office has issued two pamphlets (1) Averages of Bright Sunshine for the British Isles for Periods ending 1935 and (2) Averages of Temperature for the British Isles for Periods ending 1935 The former has 43 pages and conforms to the same principle as a previous report noticed in this *Journal* on January 26, 1935 p 158 The latter—52 pages—has two tables (i) showing monthly and annual averages of mean maximum mean minimum and mean temperature (ii) showing monthly and annual averages of temperature at fixed hours These are followed by a list of 294 stations from which observations were recorded This list serves as a useful index The reports should prove a valuable guide to doctors who have to advise convalescent patients They are published at 1s and 1s 3d respectively (postage extra) and can be obtained from H M Stationery Office or through any bookseller

The French Minister of Public Health has issued an order to the effect that artificially irradiated foods may be sold only by chemists This is a sequel to the denunciation last December at a meeting of the Academy of Medicine of the therapeutically indiscriminate sale of allegedly irradiated foods over the counters of grocers shops

Colonel Charles Leonard Isaac T D senior surgeon to the Swansea Hospital has been appointed a deputy lieutenant for the County of Glamorgan

In 1935 there were 73 101 cases of typhus and 2 002 of small pox in Soviet Russia In the same year no cases of typhus cholera yellow fever or plague were notified in Germany

QUERIES AND ANSWERS

External Use of Iodine

NEST writes This hardy plant flourishes A few years ago in your correspondence columns I quoted examples of erysipelas seen in my school clinics arising from ambulant iodine the tincture usually suffering from decomposition of age with the production of iodate For over twenty years I have forbidden its use in my own ambulance classes but it continues to be stock teaching As to friar's balsam for cuts of the nose lips and especially the ears etc this has been the stand by of my first aid pupils for more than forty years The important matter however in abrasions is surely to effect quick cleansing with trustworthy material which is also commonly available For this purpose—and neither iodine nor friar's balsam can fulfil either of these conditions—I know of nothing better than petrol I use two swabs one on the wound the other wiping vigorously the skin beyond The wound swab cleanses and keeps the patient's view submerged The youngest infant never makes a sound facial wounds as others being peacefully dealt with In the pamphlet issued by the Automobile

however efficiently the pasteurization has been carried out all this good may easily be undone if the milk is infected during the bottling Thus I would submit that in advocating pasteurization we should always for similar reasons require and associate with it some form of mechanical bottling process —I am, etc,

Chelmsford, March 16 J L MILLER WOOD

Accident and Diabetes Mellitus

SIR —It is generally accepted that the bruising of tissues leads to the production of a toxin which upsets the metabolism of diabetic subjects just as do the toxins elaborated by some bacteria and viruses, and therefore accidents cause an exacerbation of diabetes mellitus The object of this letter is to ask the assistance of the medical profession to solve the question whether accident can initiate diabetes mellitus in the same way as it is asserted that trauma can cause malignant disease or local tuberculosis A number of diabetic patients date the onset of their disease from an accident but in only a small percentage of cases can previous glycosuria be excluded I should be very grateful to those who send me brief notes of patients who were free from glycosuria and the symptoms of diabetes mellitus before an accident, and have developed glycosuria with or without symptoms following an accident, however trivial The records of the London Hospital furnish some cases, but not sufficient to permit one to make a dogmatic statement —I am, etc,

London Hospital, E 1, March 19 O LEYTON

"Blood-sugar Worship"

SIR,—Dr Guy Bousfield (*Journal*, March 20, p 636) raises a pretty point in his criticism of Dr Himsworth's statement (March 13, p 542) deploring the practice of occasional estimations of the blood sugar to the exclusion of frequent and systematic examinations for glycosuria in the treatment of diabetics He says 'Are they to be allowed to run high blood sugars throughout the day as long as they remain free from ketosis and glycosuria?' Surely the answer is yes, for how few diabetics are consistently sugar-free? The symptomatology of diabetes is dependent on ketosis and glycosuria, and is there any evidence that a high blood sugar *per se* is in any way detrimental? The aim of treatment is to produce a level blood-sugar curve below the renal threshold and yet not verging on hypoglycaemia Severe diabetics with a high renal threshold are notoriously unstable and generally intolerant to the 'normal' blood sugar If their blood sugar is lowered so that the maximum during the twenty-four hours is much below the renal threshold their minimum too often verges on hypoglycaemia

One blood sugar a day tells very little and is too often misleading Three well chosen blood sugars will give one a shrewd idea of the minimum but tell nothing of the daily sugar curve If on the other hand the patient is told to empty his bladder every three hours, in the presence of glycosuria one can gauge the curve of his blood sugar During stabilization this has the additional advantage that the fluid intake must be increased in order to obtain frequent specimens, thereby combating any tendency to dehydration I am sure that Dr Himsworth's statement points to the goal which we too frequently miss because we have lost perspective in our worship of the blood sugar

It is too changeable a factor for standardization for will it not vary with the whim of the minute? The kidney is a much better judge than the test-tube and if we must have the fetish of figures why not return to Gerrard's method of urine sugar estimation and reserve the blood sugar for the rare occasion?—I am, etc,

OLIVER WALKER

St George's Hospital, London, S W 1, March 22

The Birching of Children

SIR —I hope that the leading article on the birching of children in the *Journal* of March 20 will attract attention and will stimulate the members of our profession to express their condemnation of this barbarity It must come as a shock to many to realize that such treatment can by law be meted out to a child of the tender age of 8 Anyone reading the revolting details of a judicial birching must surely come to the conclusion that irreparable damage both physical and psychological is the inevitable result The mentality of the flogging brigade in the House of Lords is well illustrated in the two instances quoted in your article One noble lord, with striking originality, quoted Solomon's well-worn opinion on the rod and the child and thereby suggested that England in the twentieth century should be governed by the ideas of an oriental Sultan who lived hundreds of years before the Christian era Another quoted a case of sheep maiming for which he thought flogging an appropriate punishment Had his lordship possessed the merest smattering of elementary psychology (though perhaps this is too much to expect from our hereditary legislators) he would have known the meaning of that abnormal behaviour and would have known also that punishment of a sadistic nature was the worst possible treatment

If my Division supports me I shall hope to submit a resolution to the Annual Representative Meeting on this subject as it is one upon which the medical profession is well qualified to express an opinion We are proud of our English laws, but I question if we ought to be as long as they include enactments more suggestive of mediaeval Russia than of England to-day —I am, etc,

Hove, March 21 W N MAPLE

Maternal Death Rate in Glasgow

SIR —In the *Journal* of March 13 (p 579) there is a report for which I was not myself responsible of remarks I made at the annual meeting of the Glasgow Royal Maternity and Women's Hospital May I be allowed to correct an unfortunate mistake in this report in quoting statistics of the outdoor maternity services of the hospital in the last five years there have only been twelve maternal deaths in all not twelve per annum as stated in the *Journal* this is equivalent to an annual maternal death rate of 0 5 per 1 000 In view of unfair criticism of the outdoor services of maternity hospitals made recently during the Committee stage of the Maternity Services (Scotland) Bill it is important that the actual results of such services shall be accurately known —I am, etc,

The University, Glasgow, March 19 D M BLAIR

Psychiatric Clinics

SIR,—I read with great pleasure Dr Gillespie's letter (*Journal*, March 13), pointing out the need for close affiliation of psychiatric clinics with teaching hospitals The benefit to patients staff and students of actually making the clinics part of the general hospitals, as is done on the Continent and in America has appeared to us at St George's Hospital to be indisputable.

It is precisely for the reasons so excellently set forth in his letter that the lay and medical authorities have decided that the new hospital of about five hundred beds

Association forwarded with my driver's licence, it amused me to note the recommendation of iodine for motoring abrasions

Sleep Rolling

J M C (Africa) writes Our son, aged 9 years 6 months has had the habit of rolling from side to side in his sleep from his early cot days This rolling may take up so much of the night that he is obviously tired and listless next day and unable to do his school work well The rolling often begins with a sudden start as if he were dreaming, but at other times just comes on in the course of his sleep So far as I know he is always asleep when he is rolling though he makes various noises, grunting sighing, etc I fear he used to be rocked rather vigorously as a baby The only attempts to cure him have been by modifications of his evening meal and suggestions to him that the rocking is a baby trick which he should try to stop Any helpful suggestions from readers would be gratefully appreciated

Income Tax

Voluntary Dispositions for Children

'D J asks for a reference to notes in previous issues with regard to reduction of total liability for tax by means of the above -

*** Notes on the point appeared in the issues of October 19 1935 (p 731) and January 25, 1936 (p 194) The effect of the Finance Act, 1936 however, is to invalidate such dispositions as regards income tax except where the child in question is under 21 years of age

Temporary Residence in the United Kingdom

M R C S is a Government official at present on study leave and inquires as to the conditions of liability to United Kingdom income tax

*** As the residence here is for a temporary purpose M R C S ' will not be liable unless he is in the United Kingdom for six months of any one financial year—that is, reckoning the year to end on April 5 On becoming liable in that way he will be chargeable to tax on the amount of the salary remitted to him here If, on the other hand, he maintains a residence here—for example for the use of his wife—*he* becomes a resident on his arrival in the country and the six months period is not required to create liability The question is a complicated one and the Board of Inland Revenue has prepared a brief statement on the point for the information of persons visiting this country, we suggest that ' M R C S might write to Somerset House for a print of that memorandum

LETTERS, NOTES, ETC.

Ampoules of Sterile Sodium Chloride

The CHIEF CHEMIST of British Colloids Ltd (The Crookes Laboratories London N W 10) writes In the article by Hamilton Bailey W I B Stringer, and K D Keele published in the *Journal* of March 13 (p 552), the statement is made that it would be an advantage to have ampoules of sterile sodium chloride for the rapid manufacture of safe solutions for infusion May we point out that such ampoules manufactured by ourselves have been in existence for some years With the aid of one of these ampoules containing 50 c cm of solution (in the case of gum saline 100 c cm) one pint of infusion solution of normal glucose, normal glucose in saline, normal saline hypertonic saline, Ringer's solution, or gum saline can be made up instantly

"Constitutional Therapy"

Dr THOMAS B L BRYAN (London S W 1) writes As Dr Robert Hutchison and the leading article in your issue of January 9 point out modern medicine is being built upon a constitutional basis It is therefore timely to seek a system of drug therapy built upon this constitutional foundation The constitution of an organism governs its response to stimuli Thus by the responses of an organism to stimuli its constitution at the time of reaction may be estimated As an expansion of Arndt's generalization it may be stated that to a given stimulus an organism reacts differently according to the dosage of the stimulus—small doses encourage life activity large doses impede life activity very large doses destroy life activity Thus the life of an organism is maintained and its constitution strengthened by the constant reception of stimuli in small beneficial doses—for example, mental exercise, food, heat, light, mild bacterial inoculations, etc Large doses of stimuli cause disease The actual symptom complex produced in an organism by any disease stimulus at any given time depends upon the constitution of the organism at that time Hence preventive medicine aims at reducing the number of disease stimuli to a minimum and building up the constitution of the organism to the maximum curative medicine at removing the harmful stimulus, strengthening the constitution by rest food, warmth supply of deficiencies —for example, insulin haemopoietic factors etc—passive immunity, etc, and encouraging the organism to mobilize all the forces of resistance which the constitution has at its command This last object may be achieved by means of a constitutional drug, or sometimes by the use of a vaccine During an illness the constitution is under a strain and a further stimulus must be given with care hence the caution in using vaccine therapy in active disease Now the syndrome present is the only picture which we have expressing the constitution of the organism at that time If a drug is known which when given in large doses will produce this identical syndrome it has been found that it will act as a very beneficial stimulus if administered in an appropriate dose to the diseased organism This system of drug therapy which is indeed a true constitutional therapy has been and is being used very successfully by thousands of practitioners throughout the world It is not used, of course, to the exclusion of the other forms of therapy, but in sound conjunction with them

Colorimetric Tests for Oxidation-reduction

The B D H Analytical Laboratories have found it necessary to publish a second edition of their monograph *The Colorimetric Determination of Oxidation-Reduction Balance* This revised edition provides a theoretical outline of the subject explains the use of indicators in measuring oxidation reduction potentials and refers to the use of oxidation reduction determinations in biochemical work milk testing—as for example, in the Ministry of Health's methylene blue test—sewage control organic chemical analysis vitamin determinations, metallurgy, etc A copy will be sent to readers free of charge on application to British Drug Houses Analytical Laboratories Graham Street London, N 1

A Curative Shock

An account is given in the Jav press of a Sydney doctor who had a dislocation of the cervical vertebrae as a result of a violent impact with another man whilst bathing Before the x ray film showing his condition was developed the doctor in question received in the x ray department a violent electric shock which threw him across the room A subsequent x ray examination showed that the second accident had reduced the dislocation

Society of Public Analysts and Other Analytical Chemists

Mr A L BACHARACH M A F I C writes On page 631 of your issue of March 20 you report a lecture given by Professor G Barger to the Society of Public Analysts and Other Analytical Chemists I have been a member of this society for many years and am at present one of its vice presidents, but I write to you entirely in my private capacity Seeing that the membership of the society includes about 100 to 150 analysts who are either themselves public analysts or working in the laboratories of public analysts and over 600 other analytical chemists it seems to me a little unfortunate that its title should be abbreviated as it has been in your report of this lecture The society represents the scientific interests of all analytical chemists and the misleading impression given by shortening its name is particularly paradoxical when it appears in the report of a lecture that was not given by a public analyst and has nothing to do with the work of public analysts The lecture was however of the very highest interest to all of those concerned with analytical chemistry, and it is on that basis that the society's membership exists and expands

Wax Solvents

Dr J SANDISON CRABBE (Birmingham) writes If Dr G C Pether will try the following solution as ear drops for two days he will be able to empty an ear with one syringeful of warm water Sod bicarb, gr xx, glycerin 3i, aq ad 3i Use three times a day

---

We are asked to mention that Stericrepe bandages of which a notice appeared in the *Journal* of March 13 (p 560) are made by the Stericrepe Corporation, Victoria House, Southampton Row, W C 1

to be erected at Hyde Park Corner shall contain a psychiatric unit of, if possible some fifty beds The doubt as to size is a financial one, but we believe that the public will readily subscribe for a scheme which is so logical and for which all thinking people must realize the urgent need I am happy and proud to be able to assure Dr Gillespie that St George's Hospital when rebuilt, means to lead the way in putting his important suggestion into effect—I am, etc,

M F NICHOLLS
Dean of the Medical School

St George's Hospital
March 16

Typhoid Abscess

SIR—In view of the very interesting clinical memorandum in the *Journal* of January 30 (p 219) by Drs P Phillips and R T Cooke, describing the development of a typhoid abscess fifty seven years after the original infection I should like to record a similar case in which the peculiar situation of the abscess gave rise to considerable difficulty in diagnosis

The patient a woman of 52 complained of the sudden appearance of swelling of the right side of the neck on March 28 1936 A diffuse tender mass was palpable in the region of the right lobe of the thyroid extending deep to the sterno mastoid, the most probable diagnosis was thought to be haemorrhage into a thyroid cyst Routine examination showed sugar and acetone bodies in the urine subsequent blood sugar estimations proved this to be due to true diabetes The patient stated that she had been in good health since a severe attack of typhoid in 1906

The swelling increased considerably in size during the three days that the patient was under observation and was explored under general anaesthesia using the usual collar incision on May 31 After division and retraction of the platysma and pretracheal muscles a finger was inserted along the lateral aspect of the right lobe of the thyroid there was an immediate flow of creamy pus the abscess cavity apparently lying between the deep surface of the sterno mastoid and the thyroid The latter organ showed no cyst or other abnormality The wound was closed with drainage through its right lateral extremity and through a separate stab wound above the sternum Culture of the pus gave a pure growth of *B typhosus*

Convalescence and healing of the wound were uneventful and the diabetes responded rapidly to dietetic and insulin treatment A radiograph of the cervical spine showed slight osteo arthritis but no typhoid or tuberculous vertebral involvement

—I am, etc,

A C MACONIE MB, FRCS

Shanghai, March 1

Prostatectomy

SIR—I am grateful to Mr W W Galbraith (*Journal* March 20, p 638) for his endorsement of the views I published in the *Journal* of March 13 (p 581), and for his acceptance of some general suggestions in the spirit in which they were offered His appreciation of the work of the late Mr Harris will be welcomed

Mr W K Irwin (March 20 p 639) sticks to his guns with admirable fortitude but fires them indiscriminately at too many targets Incidentally he misinterprets my letter and draws erroneous conclusions

1 He writes as if I claimed to be an authority on the Harris method of procedure The honour is unmerited My experience is limited but sufficient to justify my belief that in selected cases and always provided the pre operative and post operative care insisted upon by Harris is respected the operation may be the ideal one Mr Irwin asks if I cannot eliminate haemorrhage and sepsis what are the advantages he claims for the operation? ' May I ask why he omits the qualifying paragraph? This is what I said I sometimes fear the very complications which Harris was able to eliminate—haemorrhage and sepsis—in the absence of a suprapubic drain *Unless* [the italics are mine] there is unremitting vigilance after operation and personal attention is given with unceasing regularity these disasters may occur I am sorry Mr Irwin has been the one to heap obloquy on the achievements of a great pioneer

2 I suggested that the type of operation should vary in accordance with the surroundings Mr Irwin cannot imagine any surgeon of experience undertaking a prostatectomy outside a hospital or nursing home I have never done so There are additional surroundings

3 I am taken to task for suggesting that the type of operation should fit the individual case In a tone of reproof Mr Irwin says I convey that I can evaluate the patient's power to withstand a certain operation This is one of the fundamental duties of the operating physician Judgement is the pivot upon which modern surgery revolves

4 Mr Irwin believes that what is good for the bad risk is also good for the good risk Few I think will adopt this maxim

5 I ventured to say when the gland is removed and the cavity visualized it may be obvious that the wisest course is to leave well alone Mr Irwin concludes from this that my technique often makes a long operation—which must severely tax the patient's strength and imperil the outlook My words bear the opposite meaning If Mr Irwin contends that to even look at the prostatic cavity is perilous he must have no regard for the advances of recent times Whatever the method adopted the results of prostatectomy will vary but my last case in Southend Hospital was dry and passing urine normally in ten days The cavity was visualized it was decided to leave well alone Open suction and admirable nursing did the rest

6 In advocating open suction after an experience of twenty years (not ten as erroneously stated in my letter) I mentioned that it was difficult to prove but that I was convinced *inter alia* that it lowered the incidence of post operative haemorrhage This is illogical says Mr Irwin to say the least of it Strict logic may be as devastating to the progress of surgery as microbic infection but if Mr Irwin will give suction a fair trial he will find it is not only logical but satisfactory in the manner I have indicated

Mr Irwin concludes with laudable concern for the populace He rightly condemns the surgeon who cannot separate the good from the bad and refers to him as a danger to the community On this we are all agreed My plea was not only to separate the good from the bad (especially the patients) but to do so with a sense of balanced judgement In his original communication Mr Irwin makes a good case against the abandonment of the old two stage operation He differs from most others in making it the rule and not the exception He advocates speed as a routine, 'the preliminary cystotomy or actual prostatectomy usually took only a few minutes Speed is sometimes a fickle friend indispensable at times but a legacy of bygone days Cushing and his disciples showed us the daylight in avoiding speed in brain surgery Rapidity in abdominal surgery (unless specially indicated) is under critical review Moynihan did not spare those who operated with one eye on the clock In the same sense he alludes to ' brilliant surgery such art has its proper scope in tricks with cards juggling with billiard balls and nimble encounters with bowls of vanishing goldfish '—I am etc,

W I DE C WHEELER

London W 1, March 21

SIR—After reading Mr Walter W Galbraith's second letter (*Journal* March 20 p 638) I really fail to understand what he does advocate For instance in his first letter (February 27 p 472) he states that the Harris method is 'a tremendous advance on the Thomson Walker technique Yet in his second letter

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

230 Insulin Depot Treatment

F UMBER and F K STOPPING (*Klin Wschr* November 21 1936 p 1710) describe their findings in the insulin depot treatment of seventy-two cases of diabetes of all degrees of severity They used insulin durante and depending on the severity of the case and the type of insulin used, they were able to get effects lasting from twelve hours to four days Longer effects were produced in mild cases, but only with very high doses of insulin Three great advantages of this treatment were noted (1) The daily insulin injections could be reduced in (*a*) mild cases by one morning injection of insulin durante and (*b*) severe cases by a morning and an evening injection (2) The blood sugar curve could be stabilized so that there were hypoglycaemic attacks (3) The carbohydrate intake could be more evenly distributed and increased Eleven cases of which ten had severe diabetes received ambulant treatment and were controlled over a period of two to four months The authors claim that when the individual insulin requirements of the diabetic and his reaction to it have been examined the ambulatory treatment with an insulin depot produced by insulin durante offers no further difficulties The patient's mode of life is facilitated to a degree hitherto impossible owing to the frequent injections necessary

231 Hunger and Diabetic Coma

C BRENTANO and D v KEISER (*Dtsch med Wschr* February 5 1937 p 213) point out that the literature contains hardly any references to hunger as a cause of diabetic coma Infections general anaesthesia and pregnancy are notorious causes of coma but in the authors opinion hunger plays a comparatively important part witness the fact that during the past two years they have observed as many as eight cases in which hunger precipitated an attack of diabetic coma In the same period they did not see a single case of diabetic coma developing in the course of over feeding and of late they have given a much more liberal carbohydrate ration than is prescribed in conventional diabetic dietaries The carbohydrate latitude their diabetic patients have enjoyed has never, in their opinion, precipitated an attack of coma Yet as great an authority as Umber continues to maintain that the most common cause of diabetic coma is over feeding In four of the authors cases the coma was due to too severe dieting prescribed by the doctors previously in charge of these patients The hunger verging on starvation endured by all the authors patients was partly due to anorexia or inability to take sufficient food partly to a too heroic dietetic discipline It was noteworthy that in as many as six of the eight cases treatment with insulin had never been given The authors recall that in 1910 Hofmeister showed that even in health starvation invariably leads to pancreatic insufficiency described by him as hunger diabetes The lesson of these observations is that too strict limitation of food in general and of carbohydrates in particular in diabetes may defeat its object and do far more harm than good

232 Circulatory Disturbances in Thyroid Disorder

H CURSCHMANN (*Med Welt* January 9 1937 p 37) draws attention to the circulatory disturbances in hyperthyroidism and hypothyroidism In hyperthyroidism tachycardia is the cardinal and most constant feature The pulse rate is 110 to 130 The rhythm is regular in young patients but irregular in long standing cases The systolic blood pressure is increased the diastolic normal or lowered Read's formula must never be used as a substitute for testing the basal metabolic rate On examination of the heart increased pulsation of the apex beat is noted The sounds are clear systolic murmurs are sometimes heard but never diastolic The radiograph is characterized by the pulsating action of the heart and by enlargement of both sides In the electrocardiogram the P and T waves are higher than normal the R wave lower The function of the blood vessels is disturbed The veins are dilated and easily torn at operation Vasomotor disturbances are common A degree of cardiac insufficiency is present in a large number of cases digitalis and spa treatment are helpful measures in combating it In hypothyroidism the heart is slightly enlarged the apex beat may not be felt the second sound is accentuated, the pulse is slow and soft and a relative hypotension is present Radiographs of the heart show enlargement of both sides In the electrocardiogram the normal waves are scarcely distinguishable Cardiac insufficiency is rarely present Hypothyroidism seems to have a soothing effect on the circulation and ill treated patients with hypothyroidism often appear younger than they are Estimation of the basal metabolic rate in certain cases of chronic heart disease with bradycardia and hypotension may sometimes reveal a thyroid insufficiency which has hitherto been overlooked

233 Diagnosis of Coronary Infarct

R TEUFL (*Wien klin Wschr* January 15 1937 p 58) points out that the diagnosis of coronary thrombosis is not difficult in a patient with frequent attacks of angina pectoris It is often missed when it occurs during the first anginal attack or in those cases in which the pain is atypical or in the absence of angina The intensity and duration of the pain allow of no conclusions being drawn as to the extent of anatomical disturbance Episternocardiac rub and x ray proof of an aneurysm of the heart are two signs but rarely elicited Changes in the electrocardiogram may be diagnostic of infarct but they are transitory and the apparatus is rarely to hand when required Examination of the heart by percussion and auscultation is often negative Raised temperature and leucocytosis are inconstant signs Lowering of the blood pressure is difficult to assess if the original pressure is not known Tachycardia and disturbances of conduction are valueless signs A transitory hyperglycaemia occurs but is of little worth in diagnosis The sedimentation rate is increased but in five of the author's fatal cases it was normal In Weltmann's serum coagulation test however (*Wien Arch inn Med* 1936 28) Teufl claims to have found a reliable diagnostic test for coronary thrombosis He used it successfully in twenty-eight cases of which seventeen came to necropsy

Surgery

234 Streptococcus Haemolyticus Bacteriaemia

G SHWARTZMAN and J GOLDMAN (*Arch Surg* Chicago January 1937, p 82) give the results obtained from a study of 168 cases of *Streptococcus haemolyticus* bacteriaemia during a period of five and a half years The cases were divided into two groups (1) *Strep haemolyticus* bacteriaemia following peripheral infections erysipelas infections of the upper respiratory tract thrombosis of the lateral sinus acute otitis media with meningitis pulmonary infections osseous and articular infections and surgical and gynaecological infections (2) *Strep haemolyticus* bacteriaemia associated with leukaemia agranulocytic angina neoplasms diabetes rheumatic cardiovascular dis

he tells us that in some cases he "would use the method advocated by Sir John Thomson-Walker

As to results of treatment he is equally difficult to understand In his letter of February 27 he states 'The Harris wound heals by first intention' Yet three weeks later, in his second letter he tells us "It would be wrong to say that after every Harris operation the wound remains absolutely dry when the catheter is removed

Mr Galbraith tells us that the result of the Harris operation depends almost entirely on the preliminary treatment and says that as regards the patients operated on at St Paul's Hospital by the late Mr Harris he would need to be assured that in the cases mentioned Mr Harris had complete control of the preliminary treatment before apportioning any blame for results which did not attain to the high standard he himself set I can assure Mr Galbraith that Mr Harris had complete control of the preliminary treatment in both cases and that neither healed by first intention In fact one of the patients was in hospital for sixty eight days Yet Mr Galbraith tells us that one of the most important points in favour of the Harris operation is 'the prompt healing of the abdominal wound

Mr Galbraith has stated that my whole paper "bristled with misstatements (to call them nothing worse)' He has now written two long letters and has not produced any evidence of any misstatements I note that Mr Galbraith ends his second letter by stating that "premature judgement above all things is to be deprecated" —I am etc

British Association of Radiologists

SIR —All radiologists must, I am sure think you for your annotation on radiology in its relation to medicine (*Journal* March 13 p 564) The British Association of Radiologists, and in particular its Fellowship Board should also be grateful to you for your approval of its efforts in the direction of establishing a higher diploma in radiology

It is proverbially accounted ungracious to look a gift horse in the mouth or even to appear to glance in that direction Nevertheless, I trust you will bear with me when I say that your annotation rather leaves radiotherapeutics in the cold where as in fact the association is as much concerned with it as with radiodiagnosis When the Fellowship Regulations were being drawn up it was recognized that in large cities there is some tendency for radiologists to devote themselves more or less exclusively either to radiodiagnosis or to radiotherapeutics For this reason a candidate for the Fellowship is required to choose one or other subject in which to offer himself for examination on an honours standard If he chooses radiotherapeutics he will be required to pass a modified examination in radiodiagnosis in which importance will be attached to radiographic interpretation especially in relation to history and clinical signs As regards the scope of the examination in radiotherapeutics you will perhaps allow me to quote a relevant paragraph from the official guide for candidates

> The candidate may be examined upon the use of radiation in any morbid conditions where its value has been established It is particularly to be borne in mind that knowledge confined to the use of radiotherapy in malignant disease will not satisfy the Board Nor will purely technical knowledge be regarded as sufficient A general knowledge of the conditions under treatment including their ætiology, pathology and symptoms and of therapeutic possibilities outside radiation therapy will be required The expression Radiation Therapy is defined in the Fellowship Regulations (40, xii c) as Treatment by X Rays, Radium, or other forms of Radiation"

After this year certificates to the effect that they have had special experience in radium work will be required from candidates In former issues of the *Journal* complaint has been made by correspondents that radiological diploma courses are not sufficiently concerned with treatment I express no opinion on this point, but I do wish to call attention to the fact that the association is making a serious attempt to establish a diploma which shall guarantee a very high standard of attainment in which ever subject is specially chosen by a particular candidate, and that the test will be no less searching should he choose radiotherapeutics rather than radiodiagnosis —I am, etc

T F HEWMAN-JOHNSON,
Warden

Fellowship Board British Association of Radiologists, London W 1, March 16

Prevention of Silicosis

SIR —Dr S C Blacklin (*Journal* March 13 p 586) has been good enough to take me to task for my remarks with regard to adsorption by coal particles If coal is a microbiological growth as suggested by myself (1935) and others then it is only natural that it will adsorb dyes in the manner mentioned by Dr Blacklin just as would any other similar material, but one would expect the adsorption to be of the order of monomolecular thickness not of particles, such as would be ingested into the lungs during breathing Through the courtesy of Dr W R Jones I have been able to examine a specimen of a silicotic lung from a South Wales coal-miner and there is obviously no adsorption of the type suggested by Dr Blacklin Moreover if such adsorption did occur, it is equally obvious that silicosis should not be prevalent in the South Wales coal-fields

With regard to the possibility of iodizing the air in which those subject to silicosis are working I would draw the attention of your readers to the fact that it has been seriously suggested that human beings derive their iodine from bacteria ingested in the lungs (Gmelin 1931) I do not accept this theory but before attempting to iodize the atmosphere as a germicidal precaution I would suggest that some experiments be carried out to discover the toxic dose of iodine to human beings and to micro organisms in the air otherwise it is possible that the cure may be worse than the disease A more practicable method would probably be found to lie in the use of ultra-violet light since ultra violet light employed in moderation is beneficial to man though deleterious to micro organisms —I am etc,

London, W C 1, March 15 THOMAS MCLACHLAN

Death Following Blood Transfusion

SIR —Those of us who practise blood transfusion are likely to be disturbed considerably by the fatal cases recorded by Dr N S Plummer (*Journal* December 12, 1936, p 1186) and Dr F Pygott (March 6 p 496)

In about 250 transfusions I have had only one fatal case, in a patient who died some ten days after the transfusion from what was proved to be renal blockage with acid haematin due to a delayed agglutination effect (May 5 1928, p 754) In repeating the cross agglutination

case, and tuberculosis The mortality rate was very high, averaging 54 per cent and ranging from 60 to 100 per cent in gynaecological, articular, and osseous infections, surgical post operative infections, pulmonary infections, and acute otitis media with meningitis The mortality rate in cases of secondary erysipelas was 20 per cent, while that for infections of the upper respiratory tract, peripheral infections, thrombosis of the lateral sinus, and primary erysipelas was between 34 and 50 per cent Nearly all the cases in which the primary focus was in the respiratory tract occurred in the winter and spring, while infections of the upper respiratory tract, thrombosis of the lateral sinus, and osseous and articular infections showed a tendency to occur in the early years of life The quantitative estimation of the number of haemolytic streptococci in the blood stream was of diagnostic value in cases of thrombosis of the lateral sinus, infection of the upper respiratory tract, and peripheral infection Metastases of the long bones occurred in ten cases of infection of the upper respiratory tract and showed a predilection for young children, eight of the patients being under 4 years of age The results of the investigation show that the finding of *Strep haemolyticus* in the blood stream was of important clinical significance for diagnosis, prognosis, and treatment

235 Mastitis

W T WIEMER (*Munch med Wschr*, January 22, 1937, p 132) believes that most cases of mastitis occur because early symptoms are neglected or inadequately treated Any fissure around the nipples should be sprayed with 10 per cent novocain and then cauterized with 10 per cent silver nitrate A sterile dressing is then applied Milk is pumped off for three days, when the child is suckled again In the presence of inflammation deep x ray therapy is administered on three consecutive days The temperature falls at once, and pain is relieved If there is any infiltration it is irradiated with a Sollux lamp daily until it disappears Early treatment is essential There is little hope of success in a mastitis of two days' duration In the author's experience Bier's suction pump does not give nearly as good results as deep x-ray therapy When an abscess forms it is not opened until definite fluctuation occurs It is then incised with the thermocautery The incision is as small as possible In large abscesses two or three incisions may be necessary The cavity is then washed out with antiseptic lotion The small incision gives a good cosmetic result Its edges do not heal rapidly, and therefore no drainage tube is necessary Bier's suction pump may be used in the after-treatment to evacuate the abscess painlessly and to enable the cavity to heal more quickly on account of the hyperaemia produced Wiemer in a large series of cases, has never seen any untoward results from deep x-ray therapy It does not affect the milk secretion, and the irradiated milk does not harm the child The rapid relief of pain enables the mother to suckle her child without fear of recurrence

236 Acute Appendicitis

L LAZZARINI (*Rif med* January 23, 1937 p 123) records his observations on 800 cases of appendicitis which were operated on in the surgical emergency block of the Ospedale Maggiore of Milan from 1932 to 1935 Their annual distribution and fatality were as follows 1932, 133 cases with thirty deaths (22 5 per cent), 1933, 174 cases with twenty-five deaths (14 3 per cent), 1934, 231 cases with twenty one deaths (9 per cent), 1935, 262 cases with nineteen deaths (7 25 per cent) In all the cases immediate operation was performed, in almost all the appendix showed areas of gangrene or perforation and in most of the cases the patients had been ill several days and had been treated by purgatives or enemata In addition to the importance of operating within twenty-four to forty-eight hours from the onset of the attack the writer emphasizes the necessity of removing the focus of infection and of ample drainage of Douglas's pouch

237 Angioneurotic Facial Changes after Trauma

J SEMRAU (*Hals- Nasen- Ohrenarzt*, December 1936, p 363) describes three rare cases where trauma in the head region was followed by peculiar allergic symptoms in the skin of the face A boy aged 12 received a slight blow over the right cheek, several days later he developed a sudden painless swelling of this cheek The swelling was intermittent, disappearing completely at times, sometimes it also affected the upper lip, which protruded markedly on those occasions The symptoms lasted about ten days, and then subsided after treatment with calcium A man aged 24 was concussed and rendered unconscious for twenty minutes after a fall from a height of twenty feet A week after the accident he noticed a dark brown discoloration of the skin over the nose, later the nose often became swollen under the influence of changes of temperature The discoloration and swelling of the skin over the nose remained unchanged for six months A woman aged 46 suffered a fracture of the nasal bones A few months after satisfactory healing she developed sudden intermittent swellings of the skin over the bridge of the nose, of the alae nasi, and cheeks The swollen parts had a bluish-red colour The discoloration was due to an effusion of blood into the subcutaneous tissue caused by damage to the capillary walls The pigmentation in the second case was also thought to be an obscure trophic effect connected with trauma of the vegetative nervous system There seem to be two possible explanations (1) an effect of the trauma on the centres controlling the tonus of vessels, (2) an auto intoxication by local products of tissue trauma, with a delayed allergic action

Therapeutics

238 Treatment of Puerperal Sepsis

E HOLVELMANN (*Munch med Wschr*, January 15 1937, p 93) warns against a nihilistic attitude to the treatment of puerperal sepsis on grounds of the multifarious methods of treatment evolved especially in the last ten years Prevention of exogenous infection is of paramount importance Carriers of streptococci in the throat, whether healthy or otherwise, must not attend confinements Frequent throat swabs should be taken, masks should be worn and carriers isolated Coitus shortly before the onset of labour should be forbidden as streptococci are often to be found in the male urethra Sterile examination per vaginam is to be preferred to that per rectum Normal confinements should be conducted at home as statistics show a higher incidence of sepsis in hospitals, where patients are close together Instrumental delivery should only be undertaken when absolutely necessary Conservative treatment gives the best results Vaccine therapy is valueless as antibodies cannot be produced in time Chemotherapy fails because sterilization of the uterus by chemical methods is impossible on account of the rapid growth and spread of the streptococci Serum therapy is of use only if administered early At the onset of the infection the body resistance is great, but it soon weakens Serum given early may avoid paralysis of the body's resistance to infection

239 Snake Venom in Neuralgia

M BRUNNER-ORNSTEIN (*Wien klin Wschr*, January 29, 1937, p 127) reports the results of treatment of fourteen cases of trigeminal neuralgia with cobra venom The quantities of the injected venom were calculated in mouse units (Unités souris—US) One unit is sufficient to kill a mouse of 25 grammes The initial dose is rapidly and gradually increased to four mouse units One intracutaneous injection is given every third day Six of the treated cases were cured and four were improved The author has also tried rattlesnake venom, but the results were not so good

Anaesthesia

240 Complications and Sequelae of Spinal Anaesthesia

F LIENHOOP (*Schmerz Narkose anaesth* December 1936 p 145) reports on 684 spinal anaesthesias Originally Pitkin's 'spinocaine' was used, but later the 10 per cent novocain in this was replaced by 0 8 per cent pantocaine Dosage varied from 1/2 c cm between the fourth and fifth lumbar vertebrae for low and 3/4 c cm between the first and second lumbar vertebrae for high anaesthesia the solution being mixed with an equal volume of cerebrospinal fluid Cases were carefully selected the usual contraindications observed, and precautions taken to maintain the blood pressure which seldom fell more than 20 mm Hg Investigation of the cerebro spinal fluid in fourteen cases before and at intervals after operation showed that the cell count increased six to seven times after twenty-four hours but returned to normal in eighteen days Globulin showed a trifling rise but albumin rose steadily and was nearly doubled in eighteen days Of 100 patients followed up twenty four had complaints ascribed to the anaesthesia often trivial In three cases definite neurological findings were probably due to concurrent disease Seven cases of weakness in the legs are reported but not discussed Details are given of eight deaths in most of which this anaesthesia should have been contraindicated owing to age shock or advanced illness One death apparently from phrenic paralysis through overdose occurred after 2 c cm of 5 per cent tropicocaine in a healthy woman of 24 undergoing Caesarean section The author concludes that with proper selection of cases and technique spinal anaesthesia is as safe as ether anaesthesia

241 "Twilight Sleep" in Labour

O S KREBS G L WULFF *jun* and H C WASSERMANN (*J Amer med Ass* November 21 1936 p 1704) have been using scopolamine morphine semi narcosis with good results for many years and here report in detail upon the first 2 000 cases since their last report in 1929 and the most recent 2 000 cases up to January 1 1936 The method has changed but little since its first introduction more than twenty years ago the authors beginning as soon as the patient is in active labour with morphine (1/6 grain) and scopolamine (1/133 grain) and repeating the latter alone twice at intervals of forty five minutes, and thereafter as may be required Success depends on constant attention and correct timing of the injections At delivery some inhalation anaesthesia is usually given very light chloroform—ten to fifteen drops on a gauze mask—being considered the best The authors find that this semi narcosis does not increase the foetal mortality their figures in fact showing the reverse is the case Occasional cases of oligopnoea occur, but respond to stimulation In recent years the method has been extended by the use of barbiturates (nembutal amytal etc) in combination with or preceding scopolamine the opiates being reduced or omitted entirely This combination has proved very satisfactory giving more comfort in the early stages better amnesia and less trouble from restlessness

242 Peridural Anaesthesia

K DENECKE (*Zbl Chir* January 16 1937 p 130) states that the drawbacks of Dogliotti's peridural segmental anaesthesia—namely its limited duration—the too extensive spread of analgesia the large bulk of solution used with consequent toxic symptoms from absorption and the length of time needed for the injection have prevented its wide adoption He claims that he has eliminated these disadvantages in a series of more than fifty cases and considers that the method could be developed to occupy a valuable place in surgery By the use of pantocaine in strengths of 1 in 1,000 up to 4 in 1,000 a duration of effect of two to six hours has been achieved while diffusion is prevented and the zone of analgesia sharply defined by mixing the drug with an equal volume of 5 per cent gelatin solution Usually from 7½ to 15 c cm of the mixture are used with pantocaine 3 or 4 in 1 000 The injection is made in the lateral position with the side to be operated on below The analgesia usually extends for three segments above and four below the site of puncture thus for upper abdominal operations the latter is between the eighth and ninth dorsal vertebrae for lower abdominal between the tenth and eleventh dorsal and for the region of the groin or legs between the twelfth dorsal and the first lumbar or lower In very fat patients the analgesia spreads further upwards therefore the injection should be made one or two segments lower while with thin people the reverse effect occurs With this anaesthesia there is seldom any appreciable fall in blood pressure but actually often a rise With care and practice the amount of anaesthetic used can probably be considerably reduced

243 Ether Narcosis in Diphtheritic Paralysis

HENNEBERT and SCHUERMANS (*Scalpel* Liege January 9 1937 p 336) describe a case of severe diphtheritic polyneuritis which was successfully treated by ether narcosis A hospital attendant of 28 years of age was suffering from the after effects of an unrecognized attack of diphtheria The patient suddenly became deaf in the right ear and had extreme fatigue and a partial loss of voice Neurological examination showed loss of the tendon reflexes a right hemi anaesthesia and a left hypo aesthesia of irregular distribution with paralysis of the palate Diagnosis was confirmed by bacteriological examination and suprarenal extract and strychnine were given In spite of treatment paralysis of the muscles of accommodation developed and serotherapy was tried without result At the end of five months a first ether narcosis lasting half an hour was given preceded by an injection of 20 c cm of serum a further 60 c cm being given during anaesthesia As no result was obtained a similar procedure was carried out eight days later and was followed by the disappearance of the disorders of accommodation and the velo palatin paralysis A third narcosis was given four days later without any marked improvement in the remaining symptoms but after a fourth treatment the deafness and other conditions were cured Four other cases have been treated in the same way with equal success and are fully described In one case narcosis was used in conjunction with serotherapy and strychnine in two cases with strychnine alone and in one case narcosis alone was used No experiments have been made with other forms of anaesthesia and chloroform is condemned as being too dangerous for a diphtheritic heart It is recommended that the first narcosis should be short to allow for a margin of safety the duration and intensity being increased at subsequent treatments

244 Dangers of Paravertebral Anaesthesia

P FALK (*Arch Ohr Nas Kehl heilk* December 1936 p 254) points out the danger of injecting large nerve plexuses near the vertebral column for the purposes of local anaesthesia Several cases of death after paravertebral injections in the neck have been reported in the literature and in other cases complications have developed such as temporary arrest of respiration dilated pupils temporary blindness motor paralysis of one arm etc The author experienced one fatality among well over 100 cases A woman aged 73 required a neck operation for an impacted foreign body in the oesophagus 15 c cm of 1 per cent novocain solution with the addition of some adrenaline were injected into the cervical plexus close to the roots of the transverse processes Almost immediately after completing the injection the patient complained of loss of sensation in the arms respiration ceased and within a few minutes the heart stopped in spite of artificial respiration and the usual direct stimulants to the heart

muscle The interesting post mortem finding was a small haemorrhage in the right posterior column of the spinal cord between the fourth and sixth cervical segments Not satisfied with the current explanations of vagus stimulation cerebral anaemia due to constriction of the carotid vessels by the action of adrenaline hypersensitiveness to novocain etc the author undertook various experiments on the cadaver and was able to give a convincing explanation of these rare mishaps When the point of the needle accidentally happens to lie in a large cervical nerve trunk or in a spinal ganglion and the fluid is injected under ordinary pressure the solution penetrates within the perineural sheaths directly into the subarachnoid space or into the substance of the spinal cord along the posterior nerve root This was proved by using a weak solution of methylene blue Respiratory failure results from paralysis of the phrenic nerves (fourth cervical segment) or by direct action on the respiratory centre in the medulla

Obstetrics and Gynaecology

245 Carcinoma of the Urethra

According to R VOLBRACHT (*Zbl Gynak*, December 12, 1936 p 2946) collected statistics concerning carcinoma of the urethra are few, but suffice to show a bad prognosis both from surgical and radiological therapy The former has a cure rate of some 3 to 5 per cent and is only suitable for growths which are in the earliest possible stages Radiotherapy encounters equal anatomical difficulties but a series of fourteen cases from the Berlin Universitäts-Frauenklinik showed a five-year survival in five these comprised four of vulvo-urethral and one of peri-urethral carcinoma no case of purely urethral growth surviving The treatment at present carried out is radium application to the primary growth, followed by x-ray irradiations and block dissection of the inguinal glands Too heavy a dosage of radium leads to stenoses and fistulae not more than 2,000 mg hours is recommended, and preferably half that dose For the most frequent (the vulvo urethral) form Volbracht advises against placing radium in the urethra six or seven radium needles are inserted around and parallel to the urethra, and over the tumour or ulcer is temporarily sutured a disk-shaped carrier of seven more radium needles which is perforated centrally for insertion of a rubber catheter A series of seven further cases is here described—three purely urethral and four vulvo-urethral Two are still under treatment one has remained for seven months free of recurrence, the rest on the average died within a year

246 Endometrial Histology and Pathology

R E CAMPBELL *et al* (*Surg Gynec Obstet*, December 1936, p 724) point out that, as a result of the isolation of ovarian hormones and the study of their action on the menstrual cycle and the discovery of the endometrial biopsy method with Burch's punch, a new terminology in respect of the endometrial cycle is desirable According to them it is divided into a stage of tissue loss lasting two days a stage of re-epithelization the following two days, a follicular stage lasting ten to twelve days, and a luteal stage lasting twelve to fourteen days The bleeding of normal menstruation follows regression of the corpus luteum It is by rhexis of arteries and veins The tissue loss involved is composed of the compacta and most of the spongiosa Re-epithelization is characterized by a thin endometrium with straight non-secreting glands The follicular stage is produced by the hormones of the developing Graafian follicle The special feature is cellular proliferation The endometrium increases in thickness and vascularity Mitotic figures are numerous The glands are wavy but not coiled No glycogen or mucin is present, but a *thin albuminous secretion oozes from the cells* Following ovulation the corpus luteum hormone influences the endometrium The whole endometrium becomes thicker The glands increase in size and are dilated with secretion, they become coiled and tortuous Characteristic is the elevation of the nuclei from the bases of the glandular epithelial cells, leaving a clear basal zone, which is filled with masses of glycogen Mucin appearing later than glycogen is found only in the lumen of the glands The authors recommend the biopsy method in determining the part played by endocrine disturbance in certain gynaecological conditions It should never be substituted for curettage when a neoplasm is suspected Three varieties of abnormal luteal function have been observed (1) Failure of luteinization which is common and easily diagnosed by the absence of the luteal type of endometrium, which should occur four weeks after the onset of the previous menses (2) Excessively prolonged luteal activity, possible when corpus luteum cysts exist (3) Abnormal secretion producing a "mixed picture" in the endometrium Of this the authors are sceptical Disturbed follicular function cannot occur without grave interference of ovulation and luteinization Reduction of follicular activity occurs in castrated patients in certain cases of amenorrhoea and in the menopause and premenopause Apart from these the endometrial histology resembles that of the fully developed follicular phase in a large number of cases of amenorrhoea recurrent follicular bleeding and menorrhagia But the endometrium differs from that of the normal follicular phase in three respects the glands are more irregular than normal the lining cells may be pseudo stratified more or less dilatation of the glands is present The authors state that in the latter three clinical types endometrial biopsy is not yet an adequate substitute for a good history

Pathology

247 Virus Metabolism

R F PARKER and C V SMYTHE (*J exp Med*, January 1937, p 109) have measured the oxygen absorption and acid production under anaerobic conditions of washed, cell free and bacteria-free vaccinia elementary bodies before and after additions of glucose and glucose monophosphate and sometimes methylene-blue They found a small uptake of oxygen and a small development of acid mostly during the first hour, but glucose, glucose monophosphate, and methylene-blue had no effect The results are in strong contrast with those given by bacteria and unlike those given by resting spores Tissue extracts containing an active "respiratory supplement" did not increase oxygen consumption, neither did the virus bodies accelerate red cell metabolism under aerobic or anaerobic conditions After each experiment the virus bodies were shown to have retained their infectivity by intradermal inoculation of rabbits most of them were active in a dilution of 10^{-9} Under the conditions of the experiments although these were compatible with survival of the virus virus bodies freed from host cells and bacteria were incapable of continued utilization of measurable quantities of oxygen or of continued production of appreciable amounts of acid

248 Hodgkin's Disease

V SCHILLING (*Med Welt* February 6 1937 p 167) reviews the history and aetiology of lymphogranulomatosis and the Gordon experiment Gordon and his collaborators have supplied tangible proofs of the infective theory of lymphogranulomatosis The virus however, could not be definitely identified although Gordon himself is believed to have observed the virus in the ultrafiltrate in the form of minute round granules The Gordon experiment consists in the injection of fresh macerated lymphogranulomatous tissue into the brain of a guinea-pig or rabbit In positive cases the injection is followed by a severe nervous affection of the spastic or paralytic type Experiments by other workers have confirmed to a great extent the Gordon theory, but so far no absolute proof of the validity of the theory has been obtained

BARNWOOD HOUSE
GLOUCESTER

A REGISTERED HOSPITAL for the CARE and TREATMENT OF LADIES and GENTLEMEN suffering from NERVOUS and MENTAL DISORDERS Within two miles of the G W Railway and L M & S Railway Stations at Gloucester the Hospital is easily accessible by rail from London and all parts of the United Kingdom It is beautifully situated at the foot of the Cotswold Hills and stands in its own grounds of over 300 acres Voluntary Patients of both sexes are also received for treatment

The Sun shines all the year round in

SOUTH AFRICA

SUNSHINE fresh air and rest is a prescription that can always be filled in South Africa And not the half hearted sunshine that makes a pretence of warming Europe in Winter but a full bodied lively sunshine that sends the blood coursing through the veins

For those who stand in need of such treatment South Africa possesses several excellent radio active springs situated in resorts which provide excellent accommodation and more than a little amusement to banish tedium and depression

The voyage to South Africa is in itself a delightful mélange of rest cure and tonic—providing three weeks of complete relaxation amid the warm yet bracing sea breezes of the sunny Southern Atlantic

A booklet Medicinal Springs of South Africa gives detailed information and analysis of medical waters in various parts of the country Write to South African Railways Tourist Bureau South Africa House London W C 2

WERE RECEIVED AT

THE CLINIC

in 1936

Being in effect Trustees for the Public of an institution run in the interests of the Public members of the Company now operating the Clinic feel that the above figure of patients received during 1936 will be of general interest

The Nursing Home's facilities and services are at the disposal of any Practitioner on the Register of the General Medical Council In accordance with its Constitution the Company devotes the whole of its surplus revenue to improving the amenities and equipment of the Clinic During 1936 a sum of over £7,000 was so expended of which a large part went in a thorough reorganisation of the nursing service The room rates which range from 10 guineas to 18 guineas (apart from a few suites at 25 42 guineas) average no more than 14 guineas and this includes a free dispensary service for the provision of which nearly £2 000 was spent over the past year The Secretary will be glad to forward detailed particulars and enquiries or visits from members of the Medical Profession are always welcome

MAKE THIS TEST

BEFORE YOU BUY SURGEONS' GLOVES

● Inflate the end of a finger as fully as possible Then look for telltale rubber "drip" mark at the tip of the finger! You'll find none in Seamless Standard Latex Surgeons' Gloves, for they are uniformly thin, yet tough throughout—moulded to the hand No excess rubber anywhere free from thickened spots or imperfections that dull your touch

The "gloveless" feel of Seamless Standard Latex Surgeons' Gloves is further emphasized by the accuracy of their anatomical design They do not bind or resist They co-operate with every move of your hands

Try on a pair, wet them, and note the secure and firm grip which you have on your instrument See how well they fit and feel Seamless Standard Latex Surgeons' Gloves are made for their job and do it well Made by the manufacturers of the famous *Madexte* Surgeons Gloves, unequalled at their price

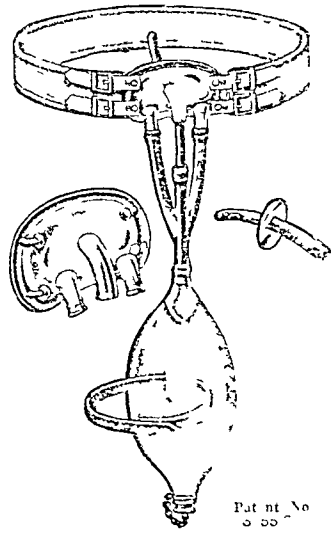
JOHN BELL & CROYDEN

Patent Triple-Drainage

SUPRA PUBIC APPARATUS

The appliance consists of a kidney shaped celluloid cup containing three outlets so arranged that no matter in what position the patient may be reposing complete drainage may be effected Provision is made not only for drainage by catheter but also for the removal of any urine which may pass between the catheter and the abdominal wall

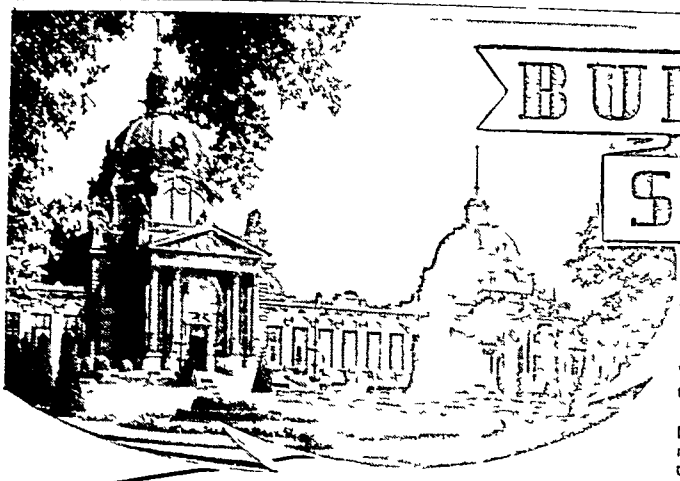


All three outlets are connected with a rubber bag fitted with a non return valve which obviates any back flow A special device fitting retains the catheter in its desired position and this should be placed between the abdomen and celluloid cup

The advantages are that the urine is immediately passed into the rubber bag all the parts can be removed and sterilized An easily detached adjustible belt is fitted

The pressure on the cup can be increased at the upper and lower border by increasing the tension in the upper or lower short webbing straps

Cleanse frequently and avoid any grease getting in contact with the rubber the celluloid must not be boiled



When ordering please state size of catheter and circumference of hips

"CERABAN" ADHESIVE SELF SUPPORTING **BANDAGE**

The Supplementary or Alternative Treatment to Self Adhesive Elastic Bandages for

SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, etc

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN" whilst free from rubber possesses elastic properties and when carefully applied to the limb gives substantial support It is porous, adhesive, and non irritating will not chafe and permits of complete respiration of the skin

In the treatment of Varicose Ulcers the use of "Ceraban" Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages In the less severe of such cases a distinguished authority writing in the *Lancet page 580 Sept 7th, 1935, issue* recommends the use of "Ceraban Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by "Ceraban" It is waterproof, antiseptic, and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip

COUNTY OF THE ISLE OF ELY

APPOINTMENT OF ASSISTANT COUNTY MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER

The County Council invite applications for the post of Assistant County Medical Officer of Health and Assistant School Medical Officer from duly qualified Medical Practitioners holding a Diploma in Public Health or an equivalent qualification in State Medicine who have had at least three years experience in the practice of their profession. The successful applicant will be required to undertake clinical work and must have spent not less than twelve months in general clinical work, which must be taken in a Hospital as Resident Officer having not less than 50 beds occupied by general medical cases and must have received appointment for a period of not less than six months in the diagnosis and treatment of cases.

The commencing salary will be £500 per annum rising by annual increments of £50 to £700 per annum. The post is designated by the provisions of the Local Government and Other Officers Superannuation Act 1922 but the applicant will be required to pass a medical examination.

The present officer holds the appointment of Assistant Medical Officer of Health to the Whittlesey Urban District Council and to the Thorney Rural District Council at salaries of £100 per annum and £30 per annum respectively plus travelling expenses. The selected candidate will be at liberty to apply for these appointments on a temporary basis.

Canvassing in any form will disqualify the candidature.

Forms of application and further details may be obtained from the County Medical Officer, County Hall, March, Cambs, to whom they should be returned not later than Friday, April 2nd, 1937.

County Hall, March. H. E. C. THURLOW
Clerk of the County Council.
March 19th, 1937.

COUNTY COUNCIL OF YORK EAST RIDING

ASSISTANT COUNTY MEDICAL OFFICER OF HEALTH

Applications are invited from Medical Men holding the Diploma in Public Health for the appointment of Assistant County Medical Officer of Health. The person appointed who will work under the direction of the County Medical Officer of Health will be required to perform such general public health work as may from time to time be required by the Council, and in addition to assist with the supervision of a residential institution for mentally defective children.

The salary will be at the rate of £500 per annum rising by annual increments of £25 to £700 per annum with an allowance in accordance with the Council's scale for the use of a motor car.

The appointment will be an established post under the Local Government and Other Officers Superannuation Act 1922 and the successful candidate will be required to pass a medical examination.

The appointment will be subject to one month's notice on either side.

Form of application may be obtained from the undersigned to whom they should be returned with copies of three recent testimonials not later than Saturday, April 10th, 1937.

County Hall, Beverley. CODLEY MACDONALD
Clerk of the Council.
March 15th, 1937.

COUNTY BOROUGH OF SMETHWICK

ST CHAD'S HOSPITAL, BIRMINGHAM

HOUSE PHYSICIAN AND ANAESTHETIST

Applications are invited from registered Medical Practitioners for the appointment of House Physician and Anæsthetist at the Council's Municipal Hospital to commence duty on May 1st. The appointment will be for a period of six months with salary at the rate of £150 per annum with the usual emoluments. If the successful candidate is reappointed for a further period of six months the salary will be at the rate of £200 per annum.

St. Chad's Hospital contains 145 beds and the cases treated include general medical, acute surgical and maternity patients. It is staffed by the Honorary Consultant of the Birmingham Teaching Hospitals.

Form of application may be obtained from the Medical Superintendent, St. Chad's Hospital, Higley Road, Birmingham, to whom application endorsed "House Physician and Anæsthetist" accompanied by copies of three recent testimonials must be delivered not later than first post on April 5th.

Canvassing directly or indirectly will disqualify.

Council House, Smethwick. FRANK CHAPMAN

NORTHAMPTONSHIRE

COUNTY MEDICAL OFFICER OF HEALTH AND CHIEF SCHOOL MEDICAL OFFICER

The Northamptonshire County Council invite applications for the appointment of County Medical Officer of Health and Chief School Medical Officer for the Administrative County of Northampton.

Applicants must be legally qualified and duly registered Medical Practitioners and hold a Diploma in Sanitary Science, Public Health or State Medicine. They must also have had previous experience in Public Health administration under a Local Government Authority.

The salary will be at the rate of £1,100 per annum payable monthly together with offices staff, stationery and such allowances for travelling and other necessary out of pocket expenses as the County Council shall from time to time approve. A periodical review of salaries is made by the County Council and suitable increments of salary will be given for proved ability and satisfactory service.

The salary will be subject to a deduction of 5 per cent. per annum for superannuation in accordance with the provisions of the Local Government and Other Officers Superannuation Act, 1922, which the County Council have adopted.

The candidate appointed will be required to pass a medical examination.

The officer appointed must reside at a place to be approved by the County Council and devote the whole of his time to the service of the Council and its Committees. He will be required to act as Medical Adviser to the County Council and its Committees, and will be responsible for the carrying out of the Public Health work now devolving upon or which may hereafter devolve upon the Council or its Committees.

The appointment is made in accordance with the provisions of Section 103 of the Local Government Act, 1933, and is to be determinable (subject to the provision of Subsection 3 of that Section) upon three months' notice on either side.

Further particulars if required may be obtained on application to the undersigned.

Applications endorsed "Medical Officer," with not more than three recent testimonials, giving full particulars of the training, qualifications, experience and age of the applicant, should reach the undersigned on or before April 5th.

Application and testimonials for the use of a member of the Public Health etc. Committee must be printed or typewritten and not less than thirty copies should be supplied for this purpose.

Canvassing will disqualify.

GOVERNMENT OF INDIA

Applications are invited for a gazetted POST in the Medical Research Department of the Government of India requiring experience in nutrition and nutritional research

2 Commencing pay will be fixed at the point in the following scale commensurate with the age qualifications etc, of the candidate selected Rs 625 for the first two years rising to Rs 750 for the next three years then for successive periods of five years to Rs 850 Rs 975 and Rs 1 150 respectively and finally to a maximum of Rs 1 350 a calendar month Rupee = 1s 6d approximately

3 Selected candidate will in the first instance be appointed on probation for two years If his work is satisfactory he will be confirmed in the Department at the end of this period

4 The appointment will be governed by the Fundamental Rules for officers of non Asiatic domicile or the Revised Leave Rules 1933 for officers of Asiatic domicile but study leave will not be granted until the completion of at least five years service

5 The post is not pensionable but on confirmation officers will be admitted to the benefits of the Contributory Provident Fund with retrospective effect from the date of their appointment on probation subscription being compulsory The selected candidate if holding a pensionable post under Government will be given the option either of retaining his pensionary status or of joining the Contributory Provident Fund Under the rules of the Contributory Provident Fund an officer subscribes a sum between 6¼ per cent and 15⅔ per cent of his pay monthly Government contributes normally the equivalent of 6¼ per cent of officer's pay plus compound interest (at present 4⅔ per cent) on the whole

6 The appointment of the confirmed officer will be reviewed after every five years in the light of the work done by him and his retention in the Medical Research Department will depend on the decision then arrived at If the work of the officer is found to be unsatisfactory as a result of this review his services will be dispensed with without compensation

7 Private practice is prohibited but laboratory and consultant practices are permitted under prescribed rules No compensatory allowance will be given in lieu of private or other practice

8 A single first class passage to India will be granted to a person recruited outside India and for a person of non Asiatic domicile only a similar return passage

9 Applications in duplicate (on forms to be obtained from the High Commissioner for India General Department India House Aldwych London W C 2) stating full name address age academic and special qualifications post graduate study and courses undertaken experience etc together with a list of original articles or papers published (reprints should be enclosed) and accompanied by copies of three recent testimonials should be submitted to the *High Commissioner for India* on or before January 15th 1937

10 Candidates may be required to attend in London for interview and medical examination

CLEMENT COBBOLD Secretary

WHY AGAROL BRAND COMPOUND FOR CONSTIPATION ?

Among the curative measures advocated for overcoming constipation, none has proved more consistently successful than AGAROL — the original emulsion of mineral oil and agar-agar with phenolphthalein.

Agarol renders the fæcal mass plastic and pliable with unabsorbable moisture. It lubricates the intestinal tract and gently stimulates peristalsis, ensuring an easy and complete evacuation.

Used over a reasonable period, Agarol gradually restores muscular tone and functional activity of the bowel, with the gratifying assurance that natural evacuation will follow without the need for further medication.

Supplied in 4½ oz 7½ oz and 17 oz bottles

Agarol is not advertised to the public.

Trial supplies to Members of the Medical Profession on request

WILLIAM R. WARNER & CO. LTD., 300, GRAY'S INN ROAD, LONDON, W.C.1.

FRANK INCH

December 22nd 1936 Hon. Sec.

(Appointments continued on p. 60)

YES

YOU CAN SAFELY PRESCRIBE THIS TEA FOR ALL YOUR PATIENTS

Not because it is specially prepared in any way whatever, but simply because it is entirely and naturally free from all excess tannin The Doctor's China Tea is a blend of the choicest teas that China grows—teas which contain much less tannin than any other teas in the world For over a quarter of a century The Doctor's China Tea has been recommended by the medical profession—even in cases of dyspepsia and gastritis A generous free sample will be sent to any doctor who would like an opportunity of trying the tea

THE DOCTOR'S CHINA TEA

Priced at 2/10, 3/4, 4/, and a super quality at 4/6 per lb

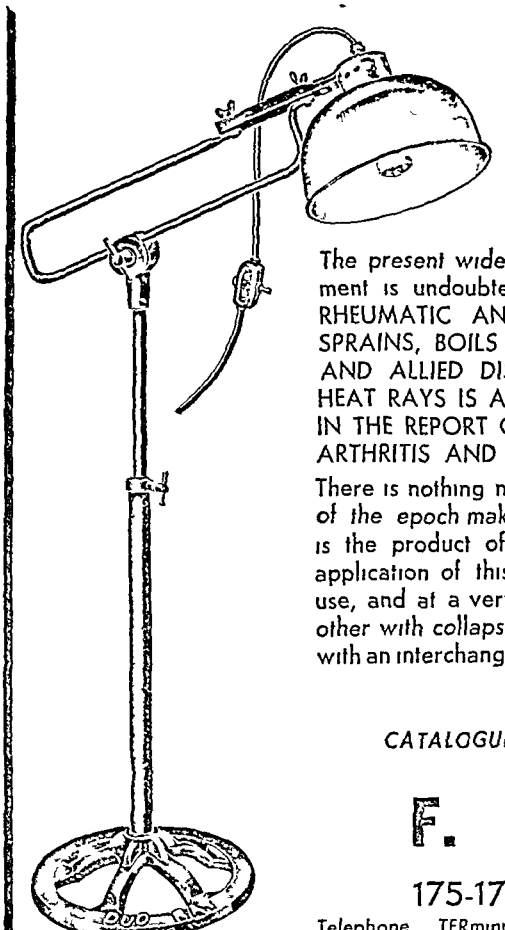
The Advantages of the Zotofoam System of Heat Therapy



Although the curative properties of heat have been familiar since Roman times, only with the introduction of Zotofoam treatment could it be claimed that a system had been evolved which made heat therapy safe, comfortable and simple

Zotofoam utilizes the remarkable insulating properties of close-textured foam Treatment can induce rapid intense perspiration and may, under certain conditions, be accompanied by a fall in pulse rate As a consequence, Zotofoam treatment may be enjoyed even by those to whom normal hot water baths are forbidden There is no sense of oppression or pressure, since the patient is surrounded only by a light mass of foam and breathes air of normal room temperature. Benefit is further enhanced by the skin-massaging action of countless bursting micro bubbles

IN GENERAL PRACTICE
The "Duo-Ray" Apparatus

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS, FIBROSITIS, SCIATICA, LUMBAGO, NEURITIS, SPRAINS, BOILS AND CARBUNCLES, PYLOROSPASM, ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED, THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J*, June 17th, 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet higly efficient apparatus for the convenient application of this form of radiation, devoid of unnecessary elaboration, perfectly safe in use, and at a very moderate cost It is supplied in two models, one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is 95/6

IMMEDIATE DELIVERY CAN BE GIVEN

When INFLUENZA threatens and COLDS cause alarm

MARMITE

The regular administration of Marmite — the yeast extract of proved medicinal and dietetic value — is particularly indicated just now

Taken as a hot drink, made with milk or water, Marmite is of considerable assistance in warding off the incipient cold or attack of influenza

Marmite contains the essential vitamins of the B group and also a distinct anti-anaemic principle It is prescribed extensively in preventive and curative medicine and its pleasant savoury flavour is especially appreciated by invalids and children

For sample and literature apply to —
THE MARMITE FOOD EXTRACT CO LTD, Walsingham House, Seething Lane, London, EC3
In jars 1 oz 6d 2 oz 10d 4 oz 1s 6d 8 oz 2s 6d 16 oz 4s 6d Special quotations for Marmite packed for use in hospitals clinics welfare centres etc

REGULOL

IN EVERY RESPECT THE IDEAL LAXATIVE

The large bowel is probably the seat or origin of a large number of chronic infections There is no need for us to emphasise this point nor is it for us to stress the eliminant effect of a regular efficient action of the bowels We would, however, like to bring to your notice our preparation Regulol This is a highly emulsified pure liquid paraffin of high viscosity combined with Agar Agar It is acceptable to the taste, efficient in action, and never gives rise to leakage

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for 'Alasil' the improved form of salicylate medication

'Alasil' is a very definite advance on ordinary compounds of salicylic or acetyl-salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelae This high tolerability is due to the fact that 'Alasil' is composed of calcium acetyl salicylate—the least irritating of the salicylate compounds—and 'Alocol' (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid

A careful series of experimental tests has shown that Alasil is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that Alasil can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities An analgesic antipyretic and sedative of established value

A supply for clinical trial with full descriptive literature sent free on request

FORAPIN

Bee Toxin in ointment form

In Myalgia, Neuralgia, Sciatica, Lumbago, Arthritis, Arthrosis and all conditions where counter irritant therapy is indicated

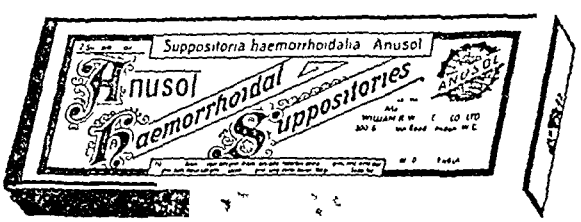
FOUR ADVANTAGES

1 The application of bee toxin in the form of an ointment, is at least equal in its effect to the older method of injection

2 FORAPIN has the advantage that its application is simple and almost painless It may be prescribed for ambulatory cases, without any constant medical supervision

3 It is possible to introduce the large amounts of toxin necessary in chronic cases, without resulting in any considerable pain

4 The preparation is inexpensive



Tubes —
FORAPIN I (Normal)
FORAPIN II
(Strong in obstinate cases)
The toxin is also available in ampoule form for intracutaneous injections

Samples and literature will gladly be sent on application to —
COATES & COOPER LIMITED

THE INEVITABLE

Even where an operation remains the only cure for haemorrhoids, Anusol brand Haemorrhoidal Suppositories will prove a source of comfort to the patient and a valuable aid to the surgeon
Styptic, anodyne, decongestive, antiseptic, yet free from opiates and local anaesthetics, Anusol Suppositories are safe in any case They alleviate pain, reduce inflammation and congestion and control bleeding
After the operation they soothe and protect the mucosa and promote healing
By softening the faecal mass they render evacuation easy and painless

May we suggest a trial of Anusol Suppositories in one of your present cases? A trial supply sent on request

This issue contains particulars of at least 30,000 changes. Changes of address are incorporated up to Oct. 1936.

THE OPERATIONS OF SURGERY

Eighth Edition. By R. P. ROWLANDS, M.S., F.R.C.S., late Surgeon to Guy's Hospital, and PHILIP TURNER, M.S., F.R.C.S., Consulting Surgeon to Guy's Hospital. Vol. I. 436 Illustrations, 28 in Colour. 70/- Vol. II. 514 Illustrations, 4 in Colour. 30/-

DISEASES OF INFANCY AND CHILDHOOD

By WILFRID SHEFFIELD, M.D., F.R.C.P., Physician to Out-patient, Hospital for Sick Children, Great Ormond Street, London. With a Foreword by Professor G. F. STILL, M.D., F.R.C.P. 137 Illustrations. 21/-

A SYNOPSIS OF HYGIENE

By W. WILSON JAMESON, M.D., F.R.C.P., D.P.H., Professor of Public Health, London University, and G. S. PARKINSON, *D.S.O.*, D.P.H., Lt.-Col., R.A.M.C. (Ret.), Assistant Director of Public Health, Division, London School of Hygiene and Tropical Medicine. *Fifth Edition.* 17 Illustrations. 21/-

QUEEN CHARLOTTE'S TEXTBOOK OF OBSTETRICS

By Members of the Staff of the Hospital. *Fourth Edition.* 4 Coloured Plates and 291 Text figures. 18/-

STARLING'S PRINCIPLES OF HUMAN PHYSIOLOGY

Seventh Edition. Edited and Revised by C. LOVATT EVANS, D.Sc., F.R.C.P., F.R.S., Jodrell Professor of Physiology, University College, London. 544 Illustrations, 6 in Colour. 24/-

TAYLOR'S PRACTICE OF MEDICINE

Fifteenth Edition. Revised and Edited by E. P. POULTON, D.M., F.R.C.P., Physician to Guy's Hospital and Collaborator. 71 Plates (16 Coloured) and 104 Text figures. 28/-

TEXTBOOK OF GYNAECOLOGY

By WILFRED SHAW, M.D., F.R.C.S., F.C.O.G., Assistant Physician Accoucheur, St. Bartholomew's Hospital. 4 Coloured Plates and 234 Text figures. 18/-

RECENT ADVANCES IN DERMATOLOGY

By W. NOEL GOLDSMITH, M.D., M.R.C.P., Physician, St. John's Hospital for Diseases of the Skin, London. 8 Coloured Plates and 80 Text figures. 15/-

THE RELIEF OF PAIN. A Handbook of Modern Analgesia

By HAROLD BALME, M.D., F.R.C.S., D.P.H., formerly Professor of Surgery and Dean of the School of Medicine, Cheeloo University, China. With an Introduction by Sir E. FARQUHAR BUZZARD, Bt., K.C.I.O., LL.D., M.D., F.R.C.P., Regius Professor of Medicine, University of Oxford. 12/6 6d.

MODERN TREATMENT OF DISEASES OF THE RESPIRATORY SYSTEM

By A. LISLE PUNCH, M.B., M.R.C.P., Senior Physician, Royal Northern Hospital, and F. A. KNOTT, M.D., M.R.C.P., Director, Bacteriological Department, Guy's Hospital. 96 Plates and 31 Text figures. 15/-

RECENT ADVANCES IN ALLERGY (Asthma, Hay-Fever, Eczema, Migraine, Etc.)

By G. W. BRAY, M.B., Ch.M., M.R.C.P., Physician in Charge of Children's Department, Prince of Wales Hospital. *Third Edition.* 107 Illustrations, including 4 Coloured Plates. 15/-

RECENT ADVANCES IN GENITO-URINARY SURGERY

By HAMILTON BAILEY, F.R.C.S., Surgeon, Royal Northern Hospital, and N. M. MATHESON, M.B., F.R.C.S., Surgeon, Central Middlesex County Hospital. 89 Illustrations. 15/-

RECENT ADVANCES IN RADIOLOGY

By PETER KERLEY, M.D., B.Ch., D.M.R.E., Assistant Radiologist, Westminster Hospital. *Second Edition.* 176 Illustrations. 15/-

MEDICAL ASPECTS OF CRIME

By W. NORWOOD EAST, M.D., F.R.C.P., H.M. Commissioner of Prisons. With a Foreword by The Rt. Hon. Sir JOHN SIMON, *G.C.S.I., K.C.I.O., M.P.*, His Majesty's Principal Secretary of State for the Home Department. 18/- Illustration. 18/-

EVANS' RECENT ADVANCES IN PHYSIOLOGY

Fifth Edition. Revised by W. H. NEWTON, M.D., M.Sc., Senior Lecturer in Physiology, University College, London. 120 Illustrations. 15/-

RECENT ADVANCES IN ENDOCRINOLOGY

By A. T. CAMERON, D.Sc., F.I.C., F.R.S.C., Professor of Biochemistry, Faculty of Medicine, University of Manitoba. *Third Edition.* 65 Figures, including 3 Plates. 15/-

ELEMENTARY PHYSICS for Medical First Year, University Science Students and General Use in Schools

By C. STEAD, M.A., F.Inst.P., Reader in Physics, University of London. *Fifth Edition.* 430 Illustrations. 12/6 6d.

A "SANDOZ" PRODUCT

BELLERGAL

THE REGULATOR OF AUTONOMIC FUNCTION

"In the treatment of autonomic dystonia it is necessary to consider the simultaneous influence of an associated sympathetic and vagus excitation Rothlin has shown that a combination of Bellafoline and Femergin is well suited as a sedative of the autonomic nervous system, particularly as regards peripheral hypertonicity The addition of phenobarbital, a sedative of the central nervous system, to this combination gives the preparation known as Bellergal which is now established as the remedy of choice for the treatment of autonomic dystonia"

MIL-SAN

the scientific contraceptive

MIL-SAN is a bland, non injurious, spermicidal jelly independent of variable physiological conditions of moisture or temperature Since there is nothing to melt, dissolve or foam MIL-SAN is immediately effective

The formula of MIL-SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina Its spermicidal efficiency is due to (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane, (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices forming a chemical barrier preventing the penetration of spermatozoa into the os uteri

The method of applying the jelly is simple, hygienic, and proof against carelessness Each application of 7 c.c is contained in a specially made strong glass tube sealed at one end with a cork, at the other by a hard wax plug In use the cork is removed, a bulb fitted behind the wax plug and the tube inserted Compression of the bulb forces the wax plug down the tube and ejects the contents The empty tube which is thrown away proves the application and ensures the quantity There is nothing to fill, nothing to clean Each application is hygienic and complete

MIL SAN does not deteriorate and is not affected by climatic conditions

Literature setting out the ingredients and full particulars together with a box of specimen tubes for examination are sent on request to members of the medical profession

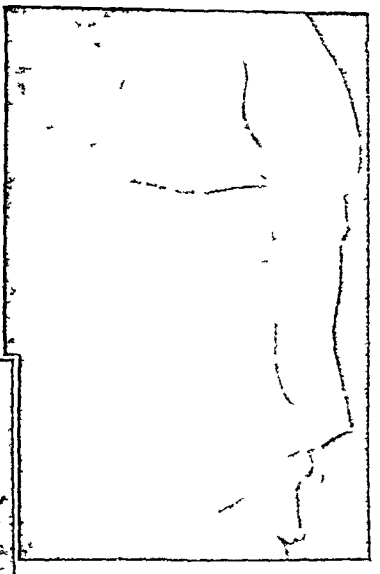
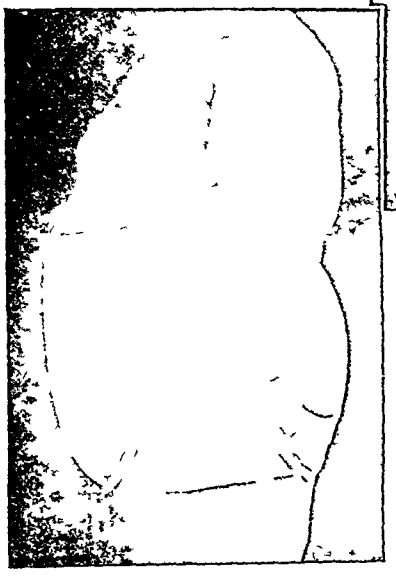
FOR HERNIA CASES WHERE SUPPORT IS NEEDED

A Spencer Support Provides Real Comfort



It will assist in the control of reducible Hernia and in restoring the patient to reasonably normal activity

To be effective a support for hernia must stay in place securely and must be comfortable in order to obtain the patient's full co operation



That is why each Spencer Support is individually designed to meet the specific needs of the patient This ensures satisfactory fit comfort and that secure anchorage of the garment to the figure necessary to prevent it from riding or slipping out of place when the patient is standing moving or sitting

Doctors have found Spencer Hernia Supports to be useful in assisting in the control of inoperable cases and for all other hernia cases where support is needed Some Doctors prescribe them as a prophylactic measure especially the Spencer Post-Operative Support designed to offer minimum interference with the natural restoration of the tone of abdominal muscles

Spencer Supports for Hernia like all other Spencers are liked by patients because they are light in weight comfortable flexible easily laundered and particularly because they greatly improve appearance Spencers have no hard rubber or heavy metal parts Yet they are strong well made durable—and provide maximum security for the patient With each Spencer there is a written guarantee that it will NEVER lose its shape

Photograph of a woman with inoperable hernia weighing exactly five pounds

Same woman (at left) wearing a Spencer

Photograph of the same woman fitted above the hernia effectively controlled and her personal appearance improved

A scientifically trained Spencer Corsetiere will call at your surgery or at your patient's home to take measurements under your supervision

Spencer Supports and Corsets are never sold in shops

ANAHÆMIN B.D.H.

the anti-anæmic principal of liver

The potency of Anahæmin B D H in causing blood-regeneration in pernicious anæmia was established by clinical trials reported upon in the Lancet of February 15th, 1936, p 349

In a later investigation upon the potency of a more purified anahæmin in comparison with the product used in the original clinical trials, it was found that doses varying *from* 1 c c up to 4 c c, according to the severity of the case, produced a high reticulocyte response and a rapid improvement in the blood picture, as well as a remission of all the characteristic symptoms The conclusion drawn from this investigation was that 'the more purified product has not less than two and a half times the potency of the original anahæmin ' (Lancet, December 26, 1936, p 1515)

ALL ANAHÆMIN B D H IS NOW OF THIS IMPROVED PURITY AND INCREASED ACTIVITY '

For a Tired Stomach"

In the treatment of disorders of the stomach

A finely-divided powder combining six valuable digestive agents, 'BISODOL,' the balanced antacid digestant, has a formula designed not only to relieve discomfort immediately, but to correct any disturbance in the acid-base balance of the body

It is indicated in hyperchlorhydria, sickness of pregnancy, and most of the functional and organic disorders of the stomach—and their *sequelæ*

The illustration shows a gastric ulcer in a typical situation on the lesser curvature of the stomach

'BISODOL' CONTAINS —

BISMUTH SUBNITRATE
Now recognised as one of the most efficient ingredients for relieving neuralgic and inflammatory conditions of the gastric mucous membrane

SODIUM BICARBONATE
For the purpose of providing immediate relief from acidity and flatulence This constituent acts in conjunction with—

MAGNESIUM CARBONATE
An insoluble substance which absorbs acidity as it arises It acts as a balance and is an ideal treatment in cases of recurring acidity

PAPAIN
To dissolve proteins and adjust deficiency in digestive secretives It is active either in alkaline or acid conditions, and, unlike pepsin, is not rendered inactive by the presence of alkalies

DIASTASE
An enzyme which compensates for deficiency of salivary juices often due to insufficient mastication, and assists in the digestion of starchy foods

PEPPERMINT OIL
For its carminative action, and to make the preparation palatable

Because of its balanced combination of ingredients, 'BISODOL' avoids the usual dangers of intensive alkaline treatment, and has no contra-indications For patients requiring 'BISODOL' adapted for use in convenient tablet form, 'BISODOL' MINTS will provide an effective alternative 'BISODOL' constitutes a remarkable advance in the treatment of all disorders of the stomach

Samples and literature will gladly be sent to the Medical Profession upon request

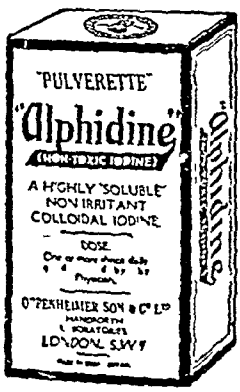
RECENT ADVANCES IN THE TREATMENT OF INFLUENZA

RESEARCH on the filtrable viruses has proved that they are present both in the common cold and Influenza, but there is no evidence that they are the causal factor

On the other hand their presence has been proved to increase and activate the pathogenicity of B Pfeiffer and other organisms associated with catarrhal conditions which under ordinary conditions are normal inhabitants of the naso-pharynx

The rational method of treatment is therefore inhibition of growth of the organisms locally to prevent the systemic disturbance arising from their toxins

Pineoleum Brand Inhalant inhibits the growth of organisms associated with nasal catarrh and is particularly selective to Bacillus Influenzae, at the same time it protects the mucous membrane from mechanical irritants and prevents secondary infections



For special Brochure Recent Advances in the Study of the Common Cold and Influenza and their Bearing on Treatment and clinical sample apply to—

Addition of BRAN to diet EFFECTIVE in 96% cases of CONSTIPATION

7½D Per Packet

Constant warnings of the evils of harsh laxatives do not deter the public from their use In fact, it would appear that the use of some form of laxative has become customary If, then, a laxative is necessary let it be a harmless and natural one

Probably it is lack of "bulk" in diet that is the most frequent cause of constipation This "bulk" is best supplied by the addition of bran to the diet Bran has proved successful in 96% of cases in laboratory tests The 4% of failures were due to the inability of the patient to tolerate "bulk" in the forms of fruit, vegetables or bran

Kellogg's ALL-BRAN, whilst retaining all the valuable properties of bran—such as iron and Vitamin B—is specially prepared to render it palatable, digestible and fine It absorbs moisture in the body and forms a soft mass which gently clears the intestines of waste

Kellogg's ALL-BRAN is enjoyed by the patient because of its delicious flavour It can be served as a cereal straight from the packet, with cold milk or cream, or can be cooked into biscuits, omelettes, cakes, etc A full-sized packet will be sent to any doctor on request

★ for the PALE CHILD

A palatable, odourless, almost tasteless form of iron

*In variable weather it is especially im*portant to raise the tone and vigour of the pale child,' by increasing the haemoglobin and red blood cell content of the blood Between the pressure of school work and play, and the discomfort of changing temperatures, the anaemic child urgently needs blood recuperation and invigoration Only iron can do that but it must be in a form *which a capricious child will* take willingly

Ovoferrin meets the needs of the blood hungry child Palatable odourless and

OVOFERRIN

BRAND COLLOIDAL IRON TONIC

almost tasteless children take Ovoferrin gladly whereas they rebel at the nauseating irritating organic salt

Ovoferrin is noted as a rapid and certain *builder* of haemoglobin and red blood cells It stimulates the jaded appetite it does not constipate it does not stain the teeth and it is retained by the most *sensitive stomach.* The dose for children is one or two teaspoonfuls in milk or water with meals Each tablespoonful the adult dose contains one grain of easily *assimilable metallic* iron in colloidal form held in this state by means of a protective protein colloid Ovoferrin is prescribed in 11 ounce bottles Trial bottle on request

Where the slightest digestive strain must be avoided

COMPLETE absence of irritants and solid precipitation makes Brand's Essence unique as a meat stimulant, and of exclusive value where the system should not support the slightest unnecessary strain. Brand's contains a highly soluble form of protein that can be digested even when organic disorder of the stomach or intestines has seriously reduced the gastric ferments and their sensitivity to stimulation. As a protein-sparer Brand's is highly efficient.

BRAND'S CHICKEN OR BEEF ESSENCE

is never contra-indicated

S.U.P. 36

In the treatment of influenza

Experience over a period of upwards of ten years has demonstrated conclusively that S U P 36 possesses the power to shorten considerably the duration of an attack of influenza

Evidence to this effect was reported (Brit Med Journ October 12 1929 p 663) as follows "If the treatment be used in influenza epidemics on a wholesale scale and early enough it is the most valuable agent that we at present have discovered for combating these epidemics"

A more recent report Brit Med Journ February 18 1933 p 290 states it has given complete satisfaction as a drug on which one can rely for positive result with no ill effects or contra indication I used it only in cases which appeared to be more severe than the average, in almost all one dose was sufficient to bring the temperature down to normal in twenty four hours"

How Convalescent
Weakly and Anaemic Patients may

TAKE THE GRAPE CURE

without going abroad

Many thousands of invalids, in ancient and modern times, have been restored to health by what is sometimes called the "grape cure" the patient stays near a vineyard and lives on nothing but fresh grapes and water A regime of this kind has, in spite of its merits, the great disadvantage that few sufferers can afford to leave their work and live on a vineyard for a number of months

This natural Grape Juice Concentrate now brings the vineyard to the home It consists of nothing but the juice of grapes, concentrated by a low temperature process, and places the therapeutic power of the living fruit in the hands of every physician *It contains no alcohol* The only change which the juice has undergone is the evaporation of most of its water content Its ferments are still alive and vigorous, its vitamins are unimpaired

Vita Grape Juice Concentrate contains about 75% of sugar, mainly in the form of glucose and laevulose Consequently it provides an ideal method of administering soluble carbo-hydrates in exceedingly palatable form

In all cases of fever and cases of heart failure, its use can be invaluable Nutritional diseases of all kinds are favourably affected, and in view of its high iron content in organic combination, it is a medicine of great benefit to anaemic patients

Additional information and a sample of Vita Grape Juice will gladly be supplied to any practitioner

CASE REPORTS

"The first case in which I observed its effects was that of a boy suffering from *secondary anaemia following rheumatic fever* After 14 days on the Grape Juice the change in his colour was striking and at the end of a further seven days he had regained his natural colour

The second case was that of a married woman suffering from *anaemia secondary to cardiac debility*

This patient was treated with extract of liver haemoglobin and the usual iron tonics but was making poor progress until she commenced taking the Grape Juice After a month of this treatment her symptoms of pallor shortness of breath and frontal headaches disappeared and her heart action improved considerably

FOR COLDS AND 'FLU

This delicious lemon and barley drink

hot or cold

The bother of making barley water—the squeezing of lemons the repeated boiling and draining of the barley—is a real trouble in the home made even busier than usual by sickness. Yet Lemon and Barley is very necessary in all febrile conditions. *This is where Lembar helps the medical man.* It is as effective for colds and influenza as home-made and quite as delicious. Made from finest lemons good Scotch barley, sugar and medicinal glucose *all ready to drink.* In all conditions of sore throat, Lembar can be safely prescribed. Although rich in lemon juice it is so soothing that it can be drunk in plentiful quantities with comfort. Calorie value and potential alkalinity excellent. Strength and richness make Lembar specially economical—a 2/ bottle makes at least one gallon of lemon and barley drink.

Charles Barker

IRRADEX

A combination of vitamins A, B, and D, together with Iron and Manganese in a palatable malt vehicle

It is becoming increasingly evident that definite amounts of each vitamin are necessary to the well being of the individual, and deficiency of one vitamin may interfere with the action of others, although they may be adequately represented in the diet

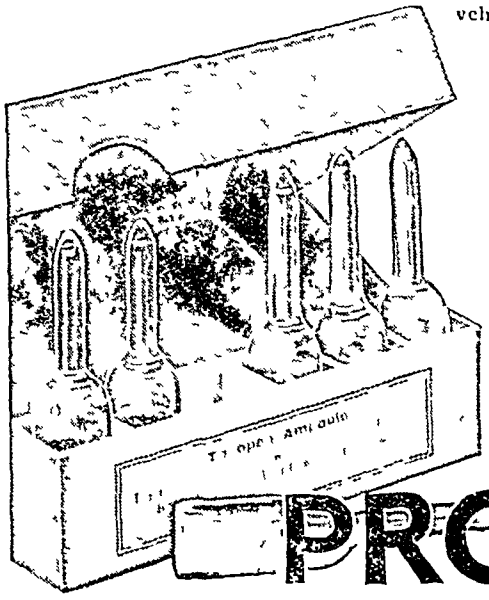
At no time is it more important to secure adequate vitamin intake than during the periods of pregnancy, lactation and infancy Not only are the vitamins A and D necessary factors for the prevention of pregnancy toxaemia, but together with iron and the vitamin B complex they are essential for the proper nutrition of the foetus During the period of lactation the vitamin requirements are enormously increased A deficiency of vitamin B may so impair the gastric secretions as to prevent absorption of iron from the alimentary tract, thus leading to a type of anaemia which is not uncommon during pregnancy and early infancy

The foregoing considerations lend support to the suggestion that Irradex is indicated for administration to pregnant women and to children in order to supply essential nutritional requirements The activity of the vitamins contained in this product is assured by carefully controlled biological assay

DOSAGE

For children	½ to 1 teaspoonful
For adults	1 dessertspoonful

These doses may be taken three times a day



Supplied in glass jars containing approximately 1 lb 2½ lbs and 7 lbs

In Pruritus Ani, Anal Fissure, Pruritus Vulvæ, etc.

"Proctocaine" is a lasting non toxic, local anæsthetic, for use in irritating or painful conditions of the skin and subcutaneous tissues It is an improved form of A B A. "Proctocaine is a combination of oil soluble anæsthetics of low toxicity These are combined so as to produce *immediate local anæsthesia* which is maintained by the slow, uniform absorption of its oily vehicle, and action of its oil soluble ingredients

The advantages of "Proctocaine" over other solutions have been found[1] to be as follows

1 *Its effect is almost certain*
2 It produces anæsthesia or hypo anæsthesia for periods varying from 7 to 28 days or longer
3 The relaxation which it produces in the anal musculature is much greater and more prolonged
4 It is comparatively non toxic injection of 20 to 30 c cm. producing no general effect
5 Even large quantities of it at one sitting have not been found to produce any local reaction if injected properly
6 Its injection is painless if made slowly
7 In no case did it produce severe after pain

urbanization of modern life and by the tendency of people to crowd together in places of amusement, offices, and public vehicles It is essential, too, that the advantages of greater air space should not be purchased at the expense of other even greater necessaries such as food

2 It is perhaps rash to speak of the relation of food to health in this city That adequate nutrition is essential to health no one would deny, and that in some parts of the world malnutrition or under-nutrition is an active cause of morbidity is undeniable To what extent these conditions prevail generally in this country except in certain impoverished areas is, however, another matter I have written at some length on this subject elsewhere (Hutchison, 1936), but here I would only say that, speaking as a clinician, I cannot admit the existence of widespread under-nutrition, or even malnutrition, among our people, and I am of opinion that the improvement in the public health to be effected by improved nutrition, and particularly by an increased consumption of the so-called "protective foods," is not likely to be as great as is often anticipated That, in short, the marriage of hygiene and agriculture, of which we hear so much, may easily prove a barren one It is not, one may suspect, a love match, but one mainly of political convenience

3 Physical education is designed to improve the physique, to strengthen muscle, and to correct deformities It aims also at making the body a more efficient servant of the mind, and at the development of mental capacity and character That, wisely directed, it is capable of doing these things there can be no doubt, but it must be remembered that there is no very definite correlation between a well-trained body and immunity to disease, and there is reason to expect that physical education will do more for happiness and character than for health

4 Maternal mortality is, of course, not an important factor in the national death rate, for the number of women who die in childbirth each year in this country is less than half the number of persons who are killed on the roads The poignant tragedy of maternal deaths must, however, stir the sympathy of everyone in a degree out of proportion to their mere frequency That such deaths can be prevented altogether is too much to hope, although to reduce them in this country by at least a quarter is well within the power of preventive medicine It is not, however, going to be a rapid process, for the first essential is an improved midwifery service, and that cannot be created in a day We must also face the fact that prevention in this matter is up against certain adverse and partly unescapable circumstances Among these are the increasing relative number of first-births and the desire, perfectly natural, that parturition should be as quick and painless as possible, which leads to the general and sometimes injudicious use of anaesthetics and to the frequent employment of forceps, or even Caesarean :tion, and other "labour-saving" devices designed to oduce motherhood without tears

These are the chief preoccupations of the public health thorities in this country to-day, and it will be observed it, with the exception of the attack on maternal mor-ity, they are not *ad hoc* measures, but are designed to se the standard of health by fortifying two of the pects of the "constitution"—the anatomical and the ysiological—of which I shall speak later They are sed, therefore, on sound scientific principles, but what ect they will have on the death rate remains to be :n The chief killing diseases among adults in this untry are cardiovascular affections and their conse-ences, cancer, pneumonia and bronchitis, renal disease, d tuberculosis, and against none of these, except the last, can the above or any other preventive measures at present do much, indeed, as the average age of the population rises, as it is bound to do, there will be a tendency for some of them to become commoner As regards tuberculosis, however, the death rate has been falling for many years, and is still going down, though to a less degree in young adults than at other ages To what extent the fall is due to the direct preventive efforts included in what is called the "anti-tuberculosis campaign" is doubtful, for it had been going on for years before that campaign was begun, but there are some authorities who believe that the wave of epidemic tuberculosis has spent itself, and that we are now getting down to the endemic level, where further reduction will be difficult To this I shall refer again later

Economic Burden of Invalidity

Morbidity, however, is as much the concern of preventive medicine as mortality, and is an even greater economic burden on a nation It is a startling fact that in Scotland more than one out of every five insured persons is certified unfit for work at one time or another during the year, and that the days of sickness amount on an average to ten per insured person The killing diseases, however, are not those which produce most invalidity, for the chief causes of certified incapacity are found to be "influenza" and upper respiratory infections, "rheumatism," "dyspepsia," and minor infections of the skin These, along with accidents, account for about three-quarters of the sickness among the insured Now it would be idle to suppose that preventive medicine can do much against these conditions at present, or that it is likely to be able to do much in the immediate future We may, it is true, discover a means of immunization against "influenza" and the infections of the upper respiratory tract, and that would be a great gain, but the prevention of "rheumatism" in its various forms baffles us, and the conditions vaguely described as "dyspepsia" are not likely to diminish with the increasing strain and complexity of modern life

Meanwhile it is pertinent to ask whether all this mass of invalidity is either genuine or necessary By that I do not mean to suggest that any of it is due to deliberate malingering, but rather that much of it may be the result of mental causes that it represents, in fact, psychoneurosis rather than physical disease The investigations of Dr J L Halliday (1935) in Glasgow and of Dr T M Ling (1936), as well as those of Dr Millais Culpin, are suggestive in this respect Are the conditions of modern industrial life to blame or are we more lacking in grit than our forefathers? Or may it be that in these days of insurance and compensation we can have as much functional disorder as we are prepared to pay for? This, at least, may be said with certainty that in future psychotherapy will have to take a place in the science of preventive medicine, for the psychological aspect of the constitution is just as important for health as the anatomical or the physiological

Diseases of Childhood and Infancy

If a further reduction of disease and of premature death among adults is likely to become increasingly difficult the case as regards children is fortunately different Among *them* the causes of death and of illness are much the same—pneumonia, bronchitis, infectious diseases, and tuberculosis taking the chief toll The disappearance of rickets, which is rapidly taking place, should at least lessen the mortality from bronchitis and pneumonia in the earlier years, and as regards the infectious diseases we should soon be able almost to abolish diph

Streptocide

(p *Aminobenzenesulphonamide Evans)*

For oral administration in Haemolytic Streptococcal Infections

Work which has been done on the "sulphonamide" derivatives indicates —

(a) That Streptocide has a bacteriostatic and bactericidal action against haemolytic streptococci in culture medium and in blood, when administered to man and animals their blood is bactericidal to haemolytic streptococci

(b) There is evidence that all sulphonamide compounds of similar type are probably converted into *p*-aminobenzenesulphonamide in the body before they become therapeutically effective The use of Streptocide therefore ensures prompt action

Although the official trials which are now being carried out, are not yet completed, there is sufficient evidence to warrant the administration of Streptocide in acute puerperal sepsis, erysipelas, tonsillitis and their sequelae

Streptocide is likely to be of service also as a prophylactic measure to minimise the risk of puerperal septicaemia in Caesarean section and abortion, for the prevention of complications attributable to haemolytic streptococci (such as otitis media, mastoiditis, arthritis and endocarditis) in scarlet fever, tonsillitis, rheumatic fever and measles, and to diminish the risk of infection in tonsillectomy

DOSE —4 to 6 tablets thrice daily reduced after clinical improvement is shown As a prophylactic 2 to 3 tablets twice or thrice daily A leaflet dealing more fully with the suggested dosage will be sent on application

Streptocide is issued in the form of compressed tablets each containing 0 25 grm

In bottles of 25 tablets, 4/-, 100, 13/6, and 250, 32/6

will be given to this important and difficult subject, for the facts from which a real science of prognosis might be built up are to a large extent already in existence, only they are buried in the literature of medicine

In the science and art of treatment, on the other hand, we can claim great advances Certainly at no previous epoch, thanks to the discovery of new anaesthetics, analgesics, and hypnotics, has illness as a whole been less disagreeable for the patient than it is now In recent years, also, we have scored some great therapeutic successes, notably over diabetes and pernicious anaemia, whilst in a great many other minor directions the attack on disease has made progress Even surgery, which was supposed by many to have reached the limit of its possibilities, has shown by its brilliant work in thoracic and intracranial disease and in affections of the sympathetic system that it is still capable of adding to our therapeutic resources

There has, however, been no great strategic advance in the science of treatment in recent times comparable to that made by the discovery of anaesthetics and antiseptics, nor does there seem to be any on the horizon, unless psychotherapy should prove to be such

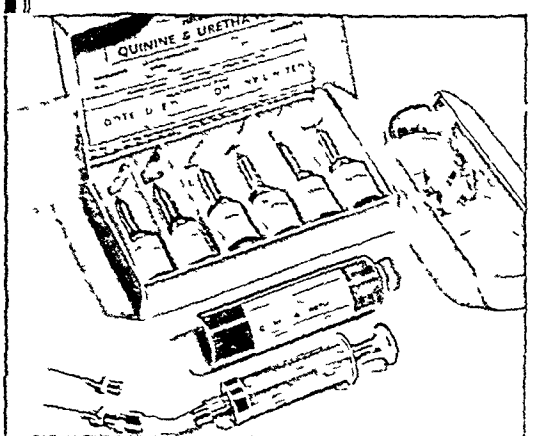
Meanwhile, what can we really do in the cure of what I have spoken of as the great killing diseases? Very little Take that "Captain of the Men of Death"—pneumonia Can we really do much more here than support Nature in the hope that the patient will recover? Or cancer, in spite of minor advances in its treatment, such as the use of radium and deep x-ray therapy, more than 60,000 persons die of it in this island every year Even in the case of pulmonary tuberculosis we are told on high authority that treatment has not advanced in the last thirty years except in that comparatively small group of cases in which artificial collapse of the lung is possible

And how little can we do for the degenerative diseases, for nephritis, and for most organic affections of the nervous system! Even in the cure of the conditions which cause invalidity rather than death we have not much to boast about Can we cure the common cold or influenza? Can we really do much in that large miscellaneous group of affections labelled "rheumatic," which account for so much time off work? As regards some of the other common causes of ill-health it seems certain that psychological methods will play a greater part in treatment—even of organic disease—in the immediate future than has been the case hitherto, but psychotherapy, though it can restore patients to happiness and usefulness, cannot claim to be able to save or even to prolong life

So few, in fact, are the diseases we can really cure that one is tempted to believe that if all doctors went on strike for a year the effect on the death rate would be inappreciable That is not to say, of course, that doctors are of no use, but only that they are of use in a different way from what the public imagines In most cases of illness the doctor is really a mental poultice, he is a source of comfort, confidence, and consolation to the patient and his friends, but if he is honest with himself he will admit that the number of patients who would have died but for his attendance is lamentably small

If this be the present aspect of the curative side of medical science where are we to look for better things in future? To bacteriology? But bacteriotherapy has not lived up to its early promise when it first gave us antidiphtheritic serum, although the intensive study of virus diseases now going on may yet bear fruit To chemistry? We badly need a chemical agent which should kill infecting agents without damaging the tissues, but the *therapia magna sterilisans* of which Ehrlich dreamt still remains a dream, although here again the recent discovery of prontosil encourages the hope that the dream may yet become a reality To endocrinology, to which so many pin their faith? But the endocrines have hitherto been of more help to the pseudo-scientific quack than to scientific therapy, and, profoundly interesting and important though they are, it is difficult to believe that even a much more complete knowledge of their action than we are ever likely to reach would help us to do much against the diseases that really count

Prophecy, however, is idle That great advances will be made we may feel tolerably sure, although the popular opinion that for every disease there is a cure, if only we could find it, is certainly a delusion, but from whence new help will come it is impossible to say, it may quite well be from outside medicine and its ancillary sciences



Reorientation of Medical Theory

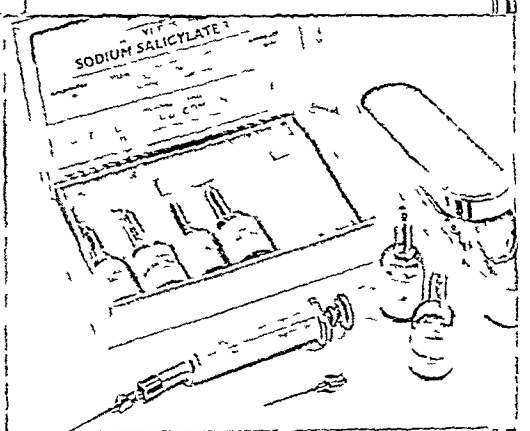
No survey of the progress and present aspect of medical science would be complete which omitted to notice the change in the underlying doctrine of medicine, as distinct from the science of it, which has been gradually coming about since the beginning of the present century Such a change although inconspicuous is important, for practice depends upon theory just as conduct depends upon one's philosophy of life This reorientation of medical theory or perhaps, to speak more accurately, this reversion, with modifications, to an older doctrine, goes by the various names of Neo-Hippocratism, Individual Medicine, and Constitutional Medicine, of which the last is perhaps the best

In Hippocratic times, as is well known, medicine was dominated by the theory of the humours, chief importance being attached to changes in the fluids of the body in the production of disease It is not generally realized how long this doctrine held sway, but one finds traces of its influence well into the nineteenth century Already, however, towards the end of the eighteenth century the counter-theory of solidism, of which Cullen was the chief exponent in this country, and which regarded changes in the solid tissues as lying at the root of all pathological processes, had been set up, and fifty years later the cellular theory of Virchow gave this way of looking at things a great impetus As the result of it the pathological changes in organs attained major importance, and the effect on practical medicine was to lead to the classification of disease by organs and systems, and to make the localization of the disease the chief aim of the clinician The art of diagnosis, in fact, came to consist in forecasting the changes which would be found after death—hence the satirical term "mortuary medicine" sometimes applied to it—and I remember that this way of looking at things was still prevalent when I was a student Further, in the last quarter of the nineteenth century bacteriological theories attained great prominence, largely under the influence of Koch, and emphasis was laid upon infecting agents in the production of disease, the part played by the soil being to a great extent ignored

Since the beginning of the present century there has been, as I have said, a gradual veering of opinion away from the rather narrow dogmas of the schools of morbid anatomy and bacteriology and towards a new outlook on the field of disease This has been brought about by three factors, which in order of their appearance are (1) the rise of biochemistry, (2) the discovery of the endocrines, (3) the striking advances in medical psychology, which we owe mainly to the genius of Freud Hence has arisen what is now often called Constitutional Medicine

For the Injection Treatment of VARICOSE VEINS

'VIULES' QUININE AND URETHANE



QUININE AND URETHANE has the advantage of being painless during injection Quinine hydrochloride, B P has been used in the preparation of this product and although less soluble than quinine bihydrochloride it has been found to be clinically much more effective in treating varicose veins

Supplied in 2 c c 3 c c and 5 c c ampoules
Single ampoules and boxes of 6 ampoules
20 c c rubber capped vials

'VIULES' SODIUM SALICYLATE 30%

SODIUM SALICYLATE 30% is of particular value in the treatment of patients who have an idiosyncrasy to quinine, and is sometimes preferred when the veins are large

Supplied in 2 c c 3 c c and 5 c c ampoules
Single ampoules and boxes of 6 ampoules

The injection treatment of Varicose Veins is fully described in our new booklet entitled—"THE TREATMENT OF VARICOSE VEINS BY INJECTION" which will be sent on request.

AUTOGENOUS URINARY PROTEOSE IN ASTHMA AND OTHER ALLERGIC CONDITIONS*

BY

JULIUS LIBMAN, M.D., M.R.C.P.

Research Assistant to the Professor of Medicine, University of Liverpool, Late Senior Medical Registrar, Liverpool Royal Infirmary

AND

A. DOUGLAS BIGLAND, M.A., M.D., F.R.C.P.

Honorary Physician Liverpool Royal Infirmary and Honorary M.O. in Charge of the Asthma Clinic Lecturer in Clinical Medicine, University of Liverpool

In 1930 Oriel and Barber published an account of a substance, "proteose," which they stated is excreted in the urine of allergic patients during attacks and contains the specific antigen to which the patient is sensitive. This "proteose" can be extracted from the urine with ether, but its precise chemical nature is not as yet known. Oriel states that it contains amino-acids, histidine, arginine, etc., and will give a positive test for carbohydrates and for protein. Boyd (1931) suggests that it is a serum albumin contaminated with a mucoid. Oriel and Barber (1930) think that the "proteose" is produced by a damaged liver and excreted in the urine. "Proteose" has also been found in the urine of normal people and in that of allergic patients between their attacks, but Oriel claims that the amount is greater during allergic paroxysms. Murray Lyon, Percival, and Stewart (1932) and Tuft and Brodsky (1932–3) support this claim, but Burgess (1933) and Vaughan (1932–3) disagree. Oriel (1933) further states that there are chemical differences in the proteose excreted by normal and asthmatic persons. He found that the latter contains three fractions, which can be precipitated with acetic acid, trichloracetic acid, and absolute alcohol, while proteose in normal subjects contains only the trichloracetic acid fraction.

Review of the Literature

Oriel and Barber (1930) state that 0·025 c.cm. autogenous proteose when injected intradermally will produce a positive reaction—that is, a wheal and erythema—in a sensitive patient. There has been much controversy as to the specificity of this proteose skin reaction. Oriel (1932) subsequently put forward the following claims: "(1) That the substance (proteose) isolated from the urine of an allergic patient during an attack would in a suitable dilution give a positive intradermal test in the patient's own skin. (2) That proteose from a normal person will not give positive tests on his skin under the same conditions. (3) That a distinction can be drawn between cases of asthma—that is that the proteose substance from a patient with multiple sensitizations gives positive skin tests with asthmatics who have been demonstrated to have similar sensitization, and not with asthmatics who have not been so sensitized. (4) It is not claimed that urinary proteose is specific to the individual."

Conybeare (1931) and others have reported positive skin reactions with urinary proteose. Conybeare (1931) tested seventy asthmatic patients with (1) proteose from an active case of hay fever, and (2) proteose from an asthma patient not sensitive to pollen. His results showed that 69 per cent. of pollen-sensitive cases gave positive reactions to hay fever patients' proteose only and 17 per cent. gave positive reactions to both. In non-sensitive cases 76 per cent. gave no positive reaction to either, 12 per cent. to hay fever proteose only, 8 per cent. to both, and 4 per cent. to proteose from the non-sensitive asthma patient. In non-allergic cases no reactions at all were obtained. Darley and Whitehead (1931) record positive skin reactions with proteose prepared from two asthmatics during an attack and negative reactions in three cases when the proteose was prepared during the asymptomatic period. They also found positive reactions in three out of five cases of acute arthritis and two out of three cases of serum sickness. Negative results were obtained in one case of generalized eczema, one case of urticaria, and one case of erythema multiforme. Yeoman, Sinclair Miller, Rutherford, and Wesley-Smith (1932) state that they have obtained positive intradermal reactions in 50 per cent. of cases of rheumatoid arthritis. Bruce Pearson (1933), working at Guy's Hospital, compared the skin reactions of fifty asthmatics with those of fifty normal people. He found that with a 1 in 1,000 dilution of proteose 54 per cent. of asthmatics reacted to their own proteose, in contrast to 6 per cent. of normal controls. He also found that 60 per cent. of asthmatics gave a positive reaction when tested with other asthmatic patients' proteose, in contrast to 40 per cent. positive reactions in controls tested with asthmatic proteose. He further showed that in protein-sensitive asthmatics 83 per cent. reacted to their own proteose and 60 per cent. reacted to normal proteose. In non-protein sensitive asthmatics 15 per cent. reacted to their own proteose and none reacted to proteose from normal persons. Among his conclusions Bruce Pearson states that there is no evidence of individual specificity, that proteose is not entirely group specific, and that asthmatic proteose is relatively toxic as judged by skin reactions. Burgess (1933) found that 16 per cent. of normal people and 69 per cent. of allergic skin patients reacted to their own proteose. Eichenlaub (1933) found positive skin reactions in three allergic skin cases.

Freeman (1932) and others do not regard the skin reaction obtained with urinary proteose as specific, but consider it is due to the toxic action of the substance. Freeman compared the skin reactions produced by (1) pollen, (2) proteose from a hay fever patient (supplied by Oriel), and (3) control proteose from a normal case. Pollen gave typical skin reactions (wheal and erythema) in hay fever, but the hay fever proteose gave variable reactions in hay fever patients and in controls. He also prepared samples of proteose from five allergic patients and tested them on (1) the subjects from whom they were prepared, (2) other allergic patients, and (3) normal persons. The same type of toxic reaction was obtained in all cases. Freeman concludes that Oriel's proteose, no matter whence obtained or on whom tested, shows a fairly constant toxic reaction within a few minutes of injection into the skin and that there is no evidence of any specific skin reaction.

Murray Lyon, Percival, and Stewart (1932) prepared samples of urinary proteose from twenty-five allergic cases and found that twenty-one of these gave reactions both in normal persons, in the patients who supplied the proteose, and in other patients with various skin conditions. Four samples did not give any reaction at all. They conclude that the peculiarity of urinary proteose with regard to the skin seems to lie not in its specificity in certain conditions but in its property of producing a local inflammatory reaction. Steel (1932) found that eleven out of twenty-seven asthmatic patients reacted to their own proteose. He also found that asthmatics who did not react to their own proteose would quite often react to that from another asthmatic. Minchin (1932) pre-

* Work undertaken during tenure of the Samuels Memorial Scholarship, University of Liverpool.

From information received —

"Twenty-two cases, all under 10 years of age suffering from B Coli pyuria most of which had been treated with various drugs without any improvement were all bacilli- and pus-free after a course of Cystopurin One of these cases had bacilluria for over five months"

Cystopurin

is the method of choice in dealing with bacterial invasion of the body by drugs acting through the blood-stream and stated generally, all infective conditions constitute indications for its use

A Genatosan product

for effective action

Samples and literature on request

GENATOSAN LIMITED, LOUGHBOROUGH, LEICS

two cases did the initial dose of 1/2 c cm of 1 in 1,000,000 dilution produce any general reaction (precipitation of severe asthmatic attacks the night following the injections), and in these cases smaller doses were subsequently given which, however, also produced reactions but of a milder character It was further found that no general or local reaction was produced by the injection of large doses of proteose, the majority of our patients having received 2 c cm of 1 in 1,000 proteose without any ill effects

The assessing of the results of treatment in asthma is notoriously very difficult Full consideration must be given to the fact that asthmatics often improve with any type of treatment for a varying interval, possibly due to psychological causes Thus, for example, Conybeare and Witts (1935), using injections of normal saline (in addition to ephedrine and specific allergen avoidance) report "At the end of two months treatment 15 per cent of the whole group are 'much improved,' 31 per cent are 'slightly improved,' and 54 per cent are 'not improved' In other words, approximately half the patients have improved '

In the presentation of these results the cases have been divided into four groups (*a*) Much improved—those showing benefit for twelve months or over, (*b*) improved —benefit for three to twelve months, (*c*) slightly improved —benefit up to three months, (*d*) the remainder The length of history, together with the severity and frequency of attacks, before and after treatment, were carefully considered in each case before placing it in one or other of these groups The results are shown in Table II, from which it will be seen that 23 per cent of the cases were markedly improved for twelve months or more

TABLE II —*Showing Results of Proteose Therapy in Present Series*

No of Cases of Asthma	Marked Improvement	Improvement	Slight Improvement	Unchanged
48	11 (23 %)	14 (29 %)	9 (19 %)	14 (29 %)

An attempt was made to ascertain if there were any special factors in the successful cases which would account for their marked response to the proteose treatment The eleven cases in the first group were therefore compared with the fourteen cases in which no improvement occurred Age, sex, family history of allergy, history of previous chest disease, duration, special precipitating factors, sputum, eosinophilia, presence or absence of nose and throat disease, were compared in the two groups It was found that the incidence of all these factors was of the same order in both groups No evidence was found to suggest that the cases with marked improvement contained a greater number of protein-sensitive cases than did the group with no improvement. It should also be noted that the cases which did well did not give any specific skin reactions We previously mentioned that two cases gave marked general reactions following the initial injections of proteose After receiving smaller doses of proteose these patients showed considerable improvement, remaining free from attacks for over twelve months These two cases were the most dramatic "cures" of our series, but we feel that in any series of asthmatics this may occasionally occur

The dosage of proteose employed in allergic skin conditions was similar to that given in the asthma series Six cases of urticaria were treated One case became free from attacks one case became free for six months, two were free for three months, and the remaining two showed no benefit One of two cases of chronic eczema improved for three months, the other case did not improve One case of dermatitis herpetiformis showed marked improvement, and one case of plant dermatitis improved for six months, but subsequently relapsed

Proteose Compared with Peptone

Desensitization by intramuscular injections of peptone is another line of treatment which has been used in this clinic The peptone course consisted of a series of graded doses of 7½ per cent peptone (Martindale), starting with 0 3 c cm and increasing by increments of 0 2 c cm to 1 3 c cm Four doses of 1 5 c cm were then given A continuation course of three doses of 2 c cm and three of 2 5 c cm was subsequently administered The injections were given at weekly intervals We have analysed a series of cases in which peptone had been administered, and contrasted the results of this treatment with those obtained in other cases on proteose medication The results have been set out in three groups, as shown in Table III

TABLE III —*Comparing Results of Proteose and Peptone Therapy in the Present Series of Asthma Cases*

	Treatment	Marked Improvement	Improved	Slight Improvement	Unchanged
Group A 26 Cases	(1) Proteose (2) Peptone	2 8	11 4	4 9	9 5
Group B 55 Cases	Peptone only	9 (16 %)	11 (20 %)	15 (27 %)	20 (37 %)
Group C 81 Cases	All cases receiving peptone	17 (21 %)	15 (18 %)	24 (30 %)	25 (31 %)

Group A consists of twenty-six patients who had previously received proteose with no improvement, or who had relapsed after some initial benefit, and were subsequently given a course of peptone This group contains a number of patients who did better on peptone than on proteose Of the nine patients in this group who received no benefit at all from proteose three received benefit up to three months with peptone and two were markedly improved for over twelve months Group B cases consist of fifty-five asthmatics who received peptone alone, and Group C contains all the eighty-one patients receiving peptone Of Group C (Table III) cases 21 per cent were markedly improved after peptone, as compared with 23 per cent in the series of proteose patients (Table II) Statistically, if one can use statistics in assessing the cure of asthma, these results would indicate that proteose and peptone have both about the same influence in the treatment of asthma, and that the results of treatment with autogenous proteose appear to be no better than those obtained with a non-specific agent The former method, too, has the following drawbacks

1 Treatment cannot be begun until the patient has had a further attack of asthma, the urine has been collected, and the proteose prepared

2 The preparation of proteose because of its individual nature, is rather expensive and laborious

Treatment by non-specific means—for example, peptone—on the other hand can be begun at any time, no laboratory preparation is necessary, the same degree of therapeutic value is obtained, and the treatment is relatively cheap

Conclusions

1 Investigations here described, together with a study of the literature tend to confirm the view that the zone of erythema obtained at the site of intradermal injection of urinary proteose is probably nothing more than a local toxic reaction and is not in any way specific

Technique

Pure sterile olive oil is used *There is no need for the* addition of gomenol, which serves no useful purpose, and merely acts in many cases as an irritant Even olive oil may produce a pleural reaction It is necessary, therefore, to use pilot doses at first 5 c cm, then, if no reaction, say, 50 c cm, then 100 c cm, then 500 c cm If there is still no reaction the total requisite amount can be given, It can be introduced gradually as each refill is due, or it can be given at one time if a hypodermic needle is inserted in the first or second intercostal space anteriorly, with the patient lying on his back, and the oil injected, say, in the mid or anterior axillary line, and continued until it runs out of the hypodermic needle above

Illustrative Cases

CASE I

In July 1925 a man aged 25 came under my observation with diabetes and pulmonary tuberculosis The diabetes was so severe that dieting and 60 units of insulin hardly controlled it There was extensive tuberculosis in the left lung of a rapidly spreading bronchopneumonic type Tubercle bacilli were present in the sputum in large numbers The temperature was high and the patient was *emaciated* Artificial pneumothorax was induced by Dr F H Young The temperature gradually fell to normal, and the general condition rapidly improved the cough, expectoration and tubercle bacilli disappeared The insulin was reduced from 60 to 15 units

After a time a large effusion appeared on the left side This was replaced twice, once by air and once by oxygen, but again recurred Fearing the progress of obliterative pleurisy which was already beginning, I decided to replace the fluid by oil in March 1926, 600 c cm of 5 per cent gomenolized olive oil were injected into the pleural cavity, At first refills of air were given above the oil In March, 1927, 250 c cm of oil were injected, on February 7th, 1928, 360 c cm, and on July 21st 390 c cm The air of the pneumothorax was gradually absorbed the oil was pushed by the pressure of the contracting pleural space to the upper zones of the chest The last two fills had to be given under great pressure, *the piston of the syringe being driven forcibly back*

The patient remained in good health, doing full work, and gained 2 st in weight In October, 1928 he was very well, and weighed 11 st there was no sugar in the urine and the blood sugar figure was 166 In March 1929 he had pneumonia In April 1929 his general condition was very good, there were no symptoms and no tubercle bacilli were present, and his weight was 11 st 8 lb In May, 1931, he had a *sudden acute diabetic coma*, and died

The post-mortem examination showed a well compressed lung, over which the oil had *remained perfectly clear* The tuberculous process was completely healed, leaving a calcareous area in the left lower lobe The specimen is in the Victoria Park Hospital Museum

CASE II

A married woman aged 24 first came under my care in *September*, 1934, with active pulmonary tuberculosis She was wasted, and had high fever, there were night sweats, haemoptysis, tubercle bacilli in large numbers, much sputum and a hectic flush Nearly the whole of the left upper lobe was excavated by a huge cavity

An artificial pneumothorax was induced on October 5th, 1934 There were numerous adhesions holding the cavity open, these were all divided in three operations by the *single cannula thoracoscope each operation* taking about an hour and a half The lung was completely freed and the cavity closed, the patient made a remarkable recovery gaining 4 st in weight Fluid, however, appeared after the last thoracoscopy, and very soon obliterative pleurisy commenced It rapidly advanced until the lung became adherent about a third of the way up the chest wall Refills were given in progressively lesser quantities and higher pressures, but, even so, this did not serve to prevent the progress of the pleural obliteration, and in a short time tubercle bacilli reappeared in the sputum

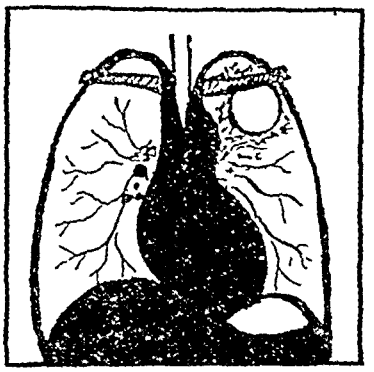

FIG 1—Acute pulmonary tuberculosis with extensive excavation, October 4th, 1934

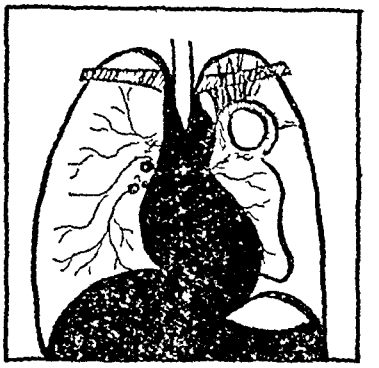

FIG 2—Artificial pneumothorax Cavity held open by numerous adhesions before division by single puncture thoracoscope, November 22nd, 1934

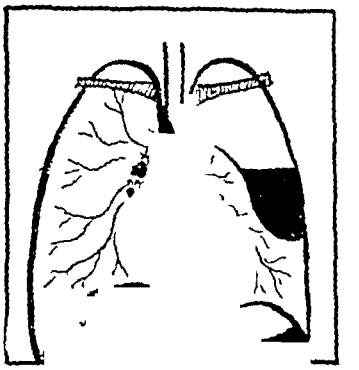

FIG 3—The lung freed, but obliterative pleurisy and some fluid, July 17th, 1935

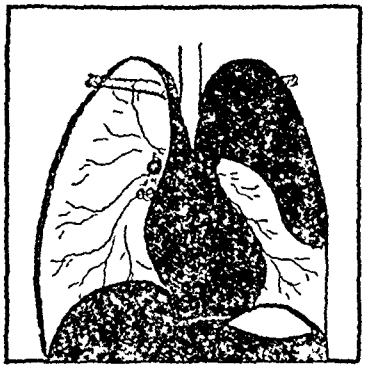

FIG 4—Oleothorax, July 15th, 1936

Oleothorax was therefore decided upon On December 9th, 1935, the patient was given 5 c cm of sterile olive oil, there was *no reaction On December* 12th she was given 140 c cm, and on the 16th 420 c cm without any reaction On December 31st she was given 40 c cm, not under undue pressure, but oil just slightly oozed out of the needle at the end of the injection On January 21st *1936, she received 20 c cm on March* 3rd 50 c cm and some air, and on May 13th a small injection of air, the final pressures being +14 and +23 On June 10th 100 c cm of oil and on August 13th 80 c cm of oil were given, making a total of 855 c cm

The patient is now in perfect health, with no symptoms and no tubercle bacilli Various stages of this case are illustrated in the diagrams

Conclusion

The true indication for oleothorax is obliterative pleurisy occurring with dangerous prematurity in the course of artificial pneumothorax treatment

THE PROGRESS AND PRESENT ASPECT OF MEDICAL SCIENCE*

BY

ROBERT HUTCHISON, M D , LL D , F R C P

Consulting Physician to the London Hospital and to the Hospital for Sick Children Great Ormond Street

Whoever has the honour to deliver the Gilchrist Lecture is spared the difficulty of a choice of subject, for the text laid down for him is The Progress and Present Aspect of Medical Science That, it need hardly be said, is a very wide subject and there is no one who has the knowledge to treat it adequately even if an hour s lecture gave him the time I must therefore apologize in advance for inevitable superficiality

Further, in depicting the present aspects of medical science, it is impossible to avoid considering medical practice also, for medicine is not a science which is studied for its own sake, but only in order that it may be applied in the prevention and treatment of disease I should also premise that much of what I shall have to say applies especially to conditions in this country, or at all events in the more highly industrialized countries of the temperate zone

Notwithstanding what has been said above, the purpose of the lecture is praiseworthy for it is worth while to attempt from time to time however imperfectly, to see where we stand I sometimes wish indeed that there could be a sabbatical year in medicine during which all research and publication should cease so that we might have leisure to sift the grain from the chaff and to consolidate the ground already won and plan out fresh advances to get out of the trees in short and survey the wood as a whole But that I recognize is merely a dream

The Present Confusion

The first impression that any survey of the present aspect of medical science must produce is one of confusion An immense amount of investigation into the causes and treatment of disease will be found going on but too often it is ill conceived and ill directed with the result that much so called 'research' is a mere beating of the air a form of solemn trifling, wasteful alike of time and money This confusion is reflected in medical publications which have become excessive in number, and often so highly specialized that their very terminology is only to be understood by the initiated full of facts and observations, but poor in ideas, in fertile hypotheses, and in helpful generalizations We find the same disorder in the application of medical science to practice for in this country at least, our health services show a chaotic mixture of individualism and socialism, of commerce, charity and State aid

Now it may be admitted at once that much of this confusion is inevitable, for medical science is engaged in a constant fight with disease and a battlefield is not the place to look for order None the less there might be more planning and direction of research a reduction in the quantity and an improvement in the quality of medical literature and some means of making it easier of access as well as a better organization of the different services concerned with health The recent report of the Committee on Scottish Health Services may perhaps pave the way to the last in Scotland

Passing from these generalities it will be convenient to consider the present aspect of preventive and curative medicine separately although of course there is no sharp line of distinction between them, curative medicine being often also really preventive

Preventive Medical Science

Of the two divisions there can be no doubt that preventive medical science although much the younger has the greater achievements to its credit for it has abolished some diseases entirely and greatly diminished the incidence of others it has enormously reduced the death rate and has added materially to the expectation of life These triumphs of course are not entirely due to medicine To a very large extent they are the result of an improvement in the economic condition of the people, to the spread of education and of temperance and to mechanical inventions of one sort and another but even allowing for these factors medical science can still claim a large share of the credit It would seem indeed as if, in this country at least there was not much more to be done in municipal hygiene —that is to say in the provision of pure water supplies efficient sanitation, and so forth, and that the law of diminishing returns is beginning to assert itself, an increase of expenditure by public authorities being attended by a smaller dividend in improved health

At present the efforts of the health authorities still further to reduce mortality and morbidity seem to be in four main directions (1) improvement of housing conditions by the abolition of slums and overcrowding (2) betterment of nutrition especially of children (3) the general introduction of physical education (4) an attack on maternal mortality Let us consider each of these for a moment

Efforts to Reduce Mortality and Morbidity

1 That better housing should lead to better health needs no argument for there is a definite correlation between density of population and morbidity mainly because when people are more closely packed the dangers of infection are increased On the other hand it must be remembered that the advantage of more space at home is to some extent counteracted by the increased

* The Dr Isaac Gilchrist Lecture Delivered before the University of Aberdeen November 12th 1936

As an example in clinical medicine I have observed the following case

A boy aged 8 years was admitted to the Derbyshire Royal Infirmary Fourteen days previously he became feverish, with loss of appetite, and slight jaundice developed The day of admission, without any warning, he became very ill, was admitted delirious, with vomiting, muscular spasms, and incontinence of urine and faeces The pupils were widely dilated, jaundice became intense, the liver was enlarged, but the spleen not palpable The van den Bergh reaction gave a biphasic reading He was treated with insulin and glucose, and after being very ill for two or three days recovered completely Eighteen months afterwards he was reported as having remained in good health

This would appear to be a clear case of necrosis of the liver as the result of infective hepatic jaundice, which stopped just short of a fatal issue The sudden onset of the serious symptoms was dramatic

Since putting these notes together a fatal case in a child has been admitted to the Derbyshire Royal Infirmary The clinical history was similar He died soon after admission There was no evidence of duodenitis or inflammation of the bile ducts, but the liver cells were necrosed

Relation to Necrosis of the Liver

These two cases may be accepted as necrosis of the liver cells arising in infective hepatic jaundice and giving rise to serious symptoms

It is reasonable to conclude that acute hepatitis is present in all cases of infective hepatic jaundice Gaskell (1933) had the opportunity of observing this post mortem in a child who died from secondary haemorrhage three days after tonsillectomy, and two days after jaundice with pyrexia had developed Findlay and Dunlop (1932) recorded "a fatal case of acute necrosis of the liver associated with epidemic catarrhal jaundice" They refer to other fatal cases recorded, and summarize the evidence from Sweden of Wallgren and Bergstrand, who recorded that from 1914 to 1925 there were only two cases per year of acute necrosis of the liver in Stockholm In 1926 and 1927 epidemic jaundice was common In the latter year there were forty-two cases of acute necrosis of the liver Most of these were adults, suggesting that the power of tissue regeneration was less than in childhood

If infective hepatic jaundice is due to a virus, which sets up acute hepatitis, if it is highly infectious in children, but well resisted by them, if most adults have acquired immunity, but those who become infected have a liver less capable of regeneration than the child, the natural history of epidemic and sporadic cases may be explained

Catarrhal Jaundice

Hurst and Simpson have discussed the features which distinguish true catarrhal jaundice from infective hepatic jaundice Post-mortem evidence of a bile duct obstructed by catarrhal inflammation is hard to come by, but there are well-authenticated examples The early symptoms of gastritis should be pronounced, and if this be the essential lesion, we should expect in an epidemic that a number of cases of gastritis without jaundice would be met with There appears to be little evidence of this, but Hurst and Simpson record the observation of one doctor, who had under his care at the same time a brother and sister, the one with uncomplicated gastro-enteritis and the other with the same symptoms followed two days later by catarrhal jaundice

I have observed two epidemics of simple jaundice in an institution In the one case there was definite gastritis preceding the jaundice and the incubation period appeared to be seven or eight days In the other epidemic, which was typical of infective hepatic jaundice, the incubation period was about twenty-five days

On theoretical grounds the van den Bergh reaction should help in differentiation, by means of a direct positive result in catarrhal jaundice giving rise to obstructive jaundice, and by obtaining a biphasic reaction in toxic hepatitis The readings, however, are not sufficiently convincing, and are probably of less value than the presence or absence of bile in the stools

Summary

Simple epidemic jaundice is discussed with the conclusion that most cases labelled catarrhal jaundice are really due to an acute hepatitis and should be called infective hepatic jaundice An isolated case may be regarded as a sporadic example of what is met with in epidemic form

When opportunity arises to observe an epidemic it is suggested that further clinical observation is required with regard to the incubation period, which appears to be three or four weeks in the hepatitis cases and may be shorter in true catarrhal jaundice In the latter condition in epidemic form we should like to obtain evidence of an infective gastritis which passed off without jaundice developing

There is considerable evidence that infective hepatic jaundice may be a serious condition requiring careful treatment, with rest and glucose (with perhaps insulin) to protect the liver cells In view of the doubtful value of our present liver efficiency tests there is need for a careful clinical study of the after-histories in those districts where epidemics have occurred

There is recorded evidence of several children beginning the illness at the same time Recently two medical officers have come under observation who both became ill within a day or two This would suggest the possibility of a carrier, or more probably infection from an abortive unrecognized attack

M A Sisti (*Policlinico* Sez Prat November 23, 1935, p 2099), who records four illustrative cases in patients aged from 19 to 56, states that he obtained successful results by treating bronchial asthma by pneumoperitoneum when other methods had failed The technique is the same as that used in the treatment of tuberculous enteritis A puncture is made with a bevelled needle three fingerbreadths below and to the left of the umbilicus and oxygen is injected with an artificial pneumothorax apparatus The quantity of gas introduced at a time varies from 250 to 350 c cm, refills should be given at first every two or four days and later every eight or ten days The duration of the treatment will depend on the clinical results The method does not involve any risks The patient has only to stay in bed in a supine position for two or three days with the pillows slightly raised to relieve the feeling of pain and dragging on the hypochondria and shoulders He can then resume his ordinary occupation

theria by immunization, whilst the use of convalescent serum when it becomes more generally obtainable should greatly mitigate the dangers of measles as antiscarlatinal serum has already enabled us to control the really dangerous manifestations of scarlet fever There is hope, too, that the preventive use of vaccines may lessen the prevalence of whooping-cough which is so often fatal in early life Much also can still be done to reduce the number of cases of tuberculosis in childhood by the universal pasteurization of milk and by protecting children more carefully from contact with tuberculous adults There is one scourge of childhood however—acute rheumatism—in the prevention of which no progress has been made nor considering our ignorance of the environmental conditions which favour its occurrence, does it seem likely to be made in the near future

The mortality of infants, as distinct from that of children has fallen by a half in the course of the present century but it must be remembered that the fall was long overdue for the death rate in children had declined much earlier What share preventive medicine has had in the spectacular fall in infant mortality it would be difficult to say, but it is probable that economic factors, smaller families, the invention of dried milk and the replacement of the horse by the motor have had as much to do with it as the work of welfare centres The practical disappearance of epidemic diarrhoea, for instance, formerly a main cause of infant deaths, cannot to my mind be attributed to any strictly preventive measures Be that as it may it is not reasonable to suppose that *prevention can do much more for nearly half of the* total infant mortality is now accounted for by neonatal deaths, the result of injury at birth, prematurity and parenteral infections and how difficult it is to prevent such deaths every obstetrician and paediatrist knows It is arguable indeed, that a diminution of neonatal deaths (those due to infections excepted) would be a doubtful blessing for many of the surviving children would probably prove to be defective either physically or mentally, or both

In later infancy, on the other hand the science of *nutrition now enables us to prevent diseases such as* rickets, formerly often so disabling and indirectly so fatal whilst as regards the infectious fevers and tuberculosis the preventive measures by which so much can be achieved in childhood, should yield relatively even greater fruits within the first year of life

The General Practitioner s Part in Prevention

Before leaving our survey of the progress and present aspects of preventive medical science reference must be made to two contemporary currents of opinion which have a bearing on the subject *One is that the general practi* tioner should take a larger share in the prevention of disease, and that the medical student, even should become —to use a *cliche* of the day— prevention-minded the other is that the community at large should be encouraged in all possible ways to become (to use another catchword) health-conscious Let me say a few words about each of these opinions

Most people, except the very bureaucratically minded will agree that the practitioner should take his part in the ordinary preventive services, such as ante-natal work welfare centres and school clinics and that his training as a student should enable him to do this efficiently Those, however who urge that the ordinary doctor should be more concerned with prevention are mostly not thinking of such activities as these but would have the idea of prevention ' enter more into private practice Yet it is difficult to see how this can be done The practitioner of course, can and does advise individual *patients as to* the best means of preserving their health, but there is little beyond this that he can do It is futile to expect him to preach to all and sundry general rules of health for in the first place there *are* no such rules which are universally applicable and in the second place *the practi*tioner would be thank Heaven, the last man to observe them in his own person But it is said he might help in the prevention of disease by diagnosing it *in its earliest* stages On this matter there is a good deal of loose thinking The question of early diagnosis only arises in more or less chronic conditions such as cancer, tuberculosis and the cardiovascular degenerations but the really early diagnosis *of internal cancer is admittedly at present* almost impossible and as regards pulmonary tuberculosis *the difficulty* is that the disease is so insidious in its early stages that it is often well advanced before the patient comes under observation Something might be done by *the more general use of radiography particularly in the* case of young adults suffering from vague ill health but the practitioner has not always got the facilities for using this method, and its adoption on a large scale is going to be both difficult and costly Or take the case of cardiovascular degeneration Suppose a doctor discovers incipient hypertension in a patient, what is he to do about it? There is no specific treatment for hypertension as we all know and it is usually idle to advise the patient to lead a sheltered life for he will reply that he has his living to earn The same difficulty arises in many other chronic conditions for it has to be remembered always in the matter of preventing and avoiding disease that only a certain price can be paid for health either by a community or by an individual Beyond a certain point the game may not be worth the candle

The objections to the attempt to produce what is called health consciousness in the community are of another sort and I have spoken of them on another occasion (Hutchison 1934) Here it is sufficient to say that whilst the amount of benefit to health to be produced by such means is problematical the danger of creating numbers of hypochondriacs is real We must beware of preaching what Stevenson called the doctrine of tin shoes and tepid milk nor need I remind a Scottish audience that we are not told in the Shorter Catechism that man s chief end is to glorify *Health* and enjoy it for ever

Curative Side of Medicine

If we turn now to consider the present aspect of the curative side of medical science we shall be struck with the fact that of its three great divisions—diagnosis prognosis and treatment—the first is by far the most advanced It may be said in fact without much exaggeration that there is little room for improvement in modern diagnosis (always excepting the early detection of cancer) when all its resources are brought adequately to bear on a case of disease On the other hand it might be argued with some *plausibility that diagnosis* is now overdone for investigations not only add greatly to the cost of illness but by detecting trivial *deviations from the normal* they confuse the boundaries between health and disease and often cause needless anxiety They are bad too for the art of medicine by encouraging students and practitioners to rely on expert reports of one sort or another instead of using their own powers of observation

The second division of curative medicine prognosis is in the least satisfactory condition of the three There are many reasons for this which cannot be considered now but it is to be hoped that in the future more attention

Although hysterical fits may be more apt to occur at menstruation it is the instability of the nervous system and the hysterical state that are more to blame than the local utero-ovarian upset He emphasizes the significance of the fact that so many of the women who exhibited the phenomenon of recurrent ocular bleeding were potential epileptics He concludes that these ocular haemorrhages, though a few were connected with the menses and a few brought on by postural effects, were for the most part not connected in any way with menstruation, the cause lying in a central psychic excitation and not in a local mechanical one

Case Report

The case which is the basis for these general remarks was that of a young girl aged 18, a hotel waitress, to whom I was first called on April 17th, 1936, as she was said to be having "fits" and "bleeding from the eyes" I arrived just after she had recovered from an attack, and was told that since August, 1935, she had suffered from recurrent attacks of bleeding from the nose, mouth, eyes, and ears accompanied by 'fits"

HISTORY

She first menstruated at the age of 16 Previously she had had "catarrh of the womb" (? discharge), which was untreated At first her periods were irregular at six-week to eight-week intervals, with loss for three to four days Later they became stabilized, lasting for four to six days every twenty-eight days, with moderate loss and spasmodic dysmenorrhoea In August, 1935, she had an attack of "? sunstroke,' when her face was very red and she had marked infra-orbital oedema She was ill for two months, and had amenorrhoea On her recovery the periods altered, to last for three days at twenty-eight to fifty-six-day intervals, with a very slight loss It was at that time (October, 1935) that the extragenital haemorrhages from the nose, mouth, ears, and eyes—chiefly the latter—began The bleeding had been seen by many people, who said that from the eyes 'drops of blood ooze out" Up to April, 1936, these haemorrhages coincided with the times for her periods, and she had the normal loss at the same time on two occasions

In November, 1935, she was operated on at Ulverston and had the 'womb stretched —presumably a dilatation and curettage—and thereafter had only menstruated *per vias naturales* twice in February and in April 1936 The other haemorrhages continued at the expected time of menstruation A point of interest is that while she was in hospital awaiting operation she saw a girl in the ward having a hysteroepileptic attack, which frightened her and made her hope she would not have similar seizures In February, 1936 there was normal uterine loss, with no extragenital haemorrhages, and two "fits" In March, 1936, there was amenorrhoea with bleeding from the eyes and a slight haematemesis In April she was seen on the third day of her period There had been numerous fits" and frequent bleeding from the eyes, nose, and ears before the onset of her period on April 14th She said she could tell when the eyes were going to bleed as the haemorrhage was preceded by an intense bilateral headache

She had had chorea in 1930 and rheumatic fever with a "diseased heart (uncorroborated on examination) There was no history of epilepsy The patient came from a mining village and had had a very unpleasant home life Her mother was dead and her father and one other sister were at home The father was more or less a sexual pervert, and had often attempted intercourse with his daughters

EXAMINATION

She was a well built well nourished girl, but rather anaemic Quite alert mentally, but during questioning she had another attack while sitting in her chair She went flaccid, her head drooped as if she were asleep, and ordinary tears poured down her cheeks from both eyes Pulse and respiration were unaltered and the corneal reflex was present The attack lasted about forty seconds, and thereafter she became quite normal again Detailed examination revealed no abnormality Heart, lungs, abdomen, mouth, throat, and eyes were all apparently normal The thyroid was not enlarged Blood pressure was 126/82 mm Hg, no abnormal constituents were discovered in the urine

Discussion

The problem presented by this case seemed extremely complex if the story were really true First, the fits might be either functional—that is, hysterical—or a true petit mal Both of these conditions, as we have seen, are quite common in relation to menstruation in women of the nervous or epileptic type Secondly, the bleeding from the mucous membranes might have two explanations (*a*) there might be some very minute self-inflicted injury, or (*b*) it might be a true example of vicarious menstruation So that the problem presented was to determine, if possible, what part was played by any functional lesion of the nervous system, and secondly, whether local treatment or gynaecological therapy by hormones, could offer any prospect of cure to the patient

At first I regarded the "fits" as being in the nature of true minor epilepsy, but subsequently revised my opinion in favour of a hysterical basis Operation seemed to be contraindicated—dilatation and curettage having been done without success—as it was likely that any further operative trauma might increase the nervous reaction of the patient

Treatment and Progress

The treatment given consisted of calcium and sodium lactate 10 grains three times a day, with phenobarbitone tablets 1/2 grain morning and night, and injections of "plurigland" (Oxo) once a week, subsequently altered to antuitrin S daily on the advice of Professor Leyland Robinson, for three days before the period and daily throughout

April 26th, 1936—Period due in fourteen days To day bled from both eyes Seen by me in surgery with dried blood on lids and cheeks No sign of injury

April 30th—Recurrence of haemorrhage from both eyes Conjunctivae flushed cornea dull, severe photophobia

May 7th—Period due on the 9th, injection of 1 c.cm antuitrin S given

May 8th—Injection of antuitrin S

May 9th—Injection of antuitrin S Patient dreads injections, and had a 'fit" in the surgery while the syringe was being filled Not a true petit mal—definitely hysterical

May 10th—Period began previous night haematemesis

May 11th—Profuse haematemesis and frequent haemorrhages from both eyes and the right ear, definitely confirmed by three witnesses

May 12th—Considerable haemorrhage from eyes and from the left ear severe haematemesis, period ceasing Admitted to Westmorland County Hospital

May 13th—During the night following admission she had slight haemorrhage from both eyes and mouth blood seen coming from the eyes during sleep slight recurrence from eyes at 3 p.m., blood pressure 120/80 mm Hg red blood cells 5,260,000 white blood cells, 6,400 per c.mm (House surgeon's count)

May 14th—Slight haemorrhage from eyes seen at 10 p.m., 10.30 p.m. and 4 a.m.

May 15th—Bled from eyes several times and from mouth and right ear

May 16th—Blood from eyes and right ear

May 17th—No further haemorrhages

May 19th—Discharged at own request to her home in West Cumberland

July 1st—Admitted to Royal Southern Hospital Liverpool, under Professor Leyland Robinson On day of admission bled from inner canthus of both eyes

Constitutional Medicine

The term 'constitution' has, of course, long been familiar in medical literature, but the thing itself, being of the nature of an abstraction, is difficult to define. On no subject, indeed, has there been more loose thinking and writing; but we may perhaps best regard it as the total make-up of the individual, physical and mental, though that, of course, was not the meaning given to the term by the Greeks. Constitution in this sense is partly inborn, and so may be hereditary, although it must be remembered that every individual is really a new amalgam or experiment—and in part, it is the effect of environmental influences. Nor is it to be regarded as a static condition, rather is it a state of flux, which varies to some extent from day to day and even from hour to hour.

Constitution as thus defined has three aspects or components. (1) The anatomical or morphological, the order of architecture as it has been called, to which the individual's body belongs. (2) The physiological or functional, the way in which his particular machine works. (3) The psychological, the intellectual and emotional peculiarities and reactions which he exhibits. These three components are closely interrelated and react upon one another so as to produce a trinity in unity, the chief integrating factors being the vegetative nervous system and the hormones acting through the blood.

That the constitutional doctrine is already influencing preventive medicine, although perhaps unconsciously, I have already indicated. Physical training is directed to building up the anatomical side or physique of the individual and improved nutrition aims at a more vigorous and harmonious working of the machine as a whole; whilst industrial psychology is beginning to throw light upon the stresses and strains to which the psychological aspect of the constitution is subjected under modern conditions; but what bearing is the new doctrine likely to have on *curative* medicine in the future? Well, in the first place it should at least save us from what has been described as the commonest fault of the prescriber—that of regarding all patients as alike. Man is not one, but 'a diversity of creatures,' and although all men may be born free they are certainly not all born equal. If this is so, it follows that there are few, if any, rules of health applicable to all individuals. We must remember the advice 'Know thyself', in other words every one must learn to manage his own machine so as to keep it in running order, and in helping him to do this there should be no one so useful as the family doctor, who in the old phrase 'Knows the patient's constitution'. It is the essence, too, of the constitutional doctrine that it recognizes that health is not a single static thing but has many degrees, and varies even from hour to hour. In the majority of persons it is true the constitution is tolerably uniform and reasonably stable, but there are not a few in whom it departs so far from the mean in one or other of its aspects as to render the possessor of it liable to certain diseases. In other words it produces a *diathesis*.

In the matter of diagnosis constitutional medicine teaches us to look for syndromes rather than for cut-and-dried diseases, the aim being to find out what is wrong with the working of the constitutional machine in any of its parts. It should therefore be specially helpful in those cases in which no precise diagnosis can be made.

As it is the essence of its doctrine to regard the body as one and indivisible every part of which through the integration of the blood, the vegetative nervous system and the hormones influences every other, constitutional medicine naturally looks for remote causes for localized effects. The fruits of this view are being seen in the growing recognition given in recent years to focal sepsis as a cause of disease and in the introduction of thyroidectomy for auricular fibrillation—even when not primarily of toxic origin—as well as in the surgery of the sympathetic system. In the matter of early diagnosis, to which I have already referred, it points to chemical changes in the body fluids and to alterations in the functional efficiency of viscera as the most hopeful line of advance. In questions of treatment it has redirected attention to the importance of the blood, and this has led to a renewed interest in blood letting, which had fallen too much into disuse, to a great development of transfusion and to the use of new methods such as protein shock.

Last, and most important of all, constitutional medicine bids us never forget that man has a mind as well as a body, and that every disease whether organic or not, has a psychological aspect. It might even be said with some truth that the greatest service which the constitutional doctrine has rendered to medicine in recent times is the emphasis which it lays upon the functional element in all disease and upon the necessity for treating it.

Conclusion

Such is a very inadequate sketch of the doctrine which in all likelihood will chiefly influence the development of medicine in the immediate future. In conclusion I am conscious that throughout this lecture I have taken what some may regard as too sober a view of the present aspect and prospects of medical science. I believe however that such an outlook is salutary, for we hear too much of the triumphs of medicine and too little of its failures, too much of the rosy prospects in store for it and too little of the difficulties to be overcome. It is surely better to face the facts without illusions for 'things are what they are and their consequences will be what they will be.' Why then should we seek to be deceived?

Mont R. Reid (*New Engl. J. Med.*, October 22, 1936, p. 753) gives particulars of the fundamental principles of wound healing. The first essential is rest after the wound has been gently cleansed by means of sterile salt solution; compound fractures of the extremities to which plaster dressings are applied heal quickly. Another important factor in the healing of wounds is an adequate blood supply. The careful spacing of skin sutures is necessary so that a moist dressing will relieve tension by permitting the oozing of serum and blood during the period of swelling or oedema in the wound. Ideal haemostasis is also invaluable as a haematoma delays healing and increases the danger of infection and suppuration. The prevention of infection should not be by means of germicides since these injure the tissues. Granulation tissue is essential to the healing of every wound and it should be protected from trauma and bleeding. Tissue growth is obviously of great importance. Emphasis is laid on the necessity of treating infected wounds by conservative methods whenever possible although if suppuration occurs some form of external drainage or excision may become necessary to avoid the damage of tension, accumulated toxins and the spreading of infection. In cases of granulating wounds where secondary closure may be desired intensive bactericidal therapy with Dakin's solution until the wound is macroscopically free of necrosis and all but a minor degree of bacterial contamination is the best course to follow.

Case IV

A patient, aged 22 years, was first seen on June 29th, 1936 She had had a normal confinement two years previously, and the periods had been regular, four-weekly, till December, 1935, then three-weekly till late March, 1936 There was no loss in April, 1936 In May she had a profuse haemorrhage, followed by daily bleeding, which was usually slight On examination the uterus was about the size of a three-months pregnancy, doughy in consistence, and uneven The os was closed On June 30th the Friedman test was positive in a dilution of 1 in 100, and a diagnosis of hydatidiform mole was made On June 7th a tent was inserted and the vagina plugged Next morning there was a profuse haemorrhage on removing the plug, and the patient collapsed A direct transfusion of 400 c cm of blood was given at 9 15 a m At 3 p m 5 c cm of 1 per cent Congo red was injected intravenously and the patient examined under an anaesthetic Most of the mole was found in the vagina, only small portions being removed from the cavity of the uterus There was very little haemorrhage, and a further blood transfusion was not considered necessary Histological examination confirmed the diagnosis The patient was discharged on July 25th, 1936 The Friedman tests carried out in this case were as follows

Date (1936)	Urine Undiluted	Urine 1 in 10	Urine 1 in 100
June 30th	Positive	Positive	Positive
July 6th	Uterus cleared		
July 9th	Positive	Weak positive	Negative
July 13th		Negative	
July 20th	Negative		
August 24th			
October 12th			
November 3rd			

Conclusion

Case I shows clearly the value of the test in revealing early those cases of hydatidiform mole which pass on to chorion epithelioma Tests are being carried out at monthly intervals on Case IV, and will be continued up to the end of a year to exclude this occurrence

Case II shows the value of the test in confirming the complete removal of the mole and in disproving any pathological significance in the brownish discharge seven months after a mole had been passed

Case III shows the value in indicating the complete removal of the uterine tumour and the absence of any secondary deposits

Case IV is interesting in showing the rapidity with which the test becomes negative after the complete removal of a mole, and also shows the value of intravenous Congo-red in preventing haemorrhage In Cases I and III panhysterectomy was performed mainly on the result of the Friedman tests, and in each case this course was completely justified

In conclusion, I wish to thank my colleagues for permission to make use of the clinical notes of the cases

---

The widow of the first Lord Manton and her four sons have made a gift of £8 000 to provide a new x-ray department for the General Infirmary at Leeds The late Lord Manton, after whom the department will be named, was a large benefactor of the hospital, he was formerly Mr Joseph Watson, head of the well-known firm of soap manufacturers Plans for the new x-ray department have already been approved and building will begin almost at once, in the expectation of completing the work by the end of this year

Clinical Memoranda

Sclerosing Submucosal Injection of the Turbinates

In the treatment of conditions such as early hypertrophic rhinitis, non-specific hay fever, and nasal asthma there is far too great a tendency to have recourse to the thermo cautery The description of a method which can produce excellent results without the same risks may be of service to those unacquainted with it The mucous membrane of the nose is lined with ciliated columnar epithelium, which has as its function the maintenance of the ciliary stream for the removal towards the nasopharynx of mucus, dust particles, and micro-organisms Once damaged this ciliated epithelium is not regenerated, but is replaced by squamous cells, with subsequent weakening, if not total loss, of the ciliary stream over the affected areas of the nasal surface The risks of cauterization are

(*a*) The production of adhesions between contiguous portions of the nasal surface, with increase of nasal obstruction, stagnation of nasal secretion, etc

(*b*) Over extensive cauterization, or repeated applications of the cautery (as is so often necessary), cause excessive damage to the ciliated epithelium Adherence of nasal secretion, with inspissation and crusting, results from the loss of the ciliary stream In the course of time ulceration occurs and the condition drifts on into a state of atrophic rhinitis, not uncommonly with fetor—that is, ozaena has been produced

On the other hand a sclerosing submucosal injection of the turbinates aims at producing scarring in the erectile tissue of the subepithelial layers of the mucosa and in the submucosal space, very little damage being done to the ciliated epithelium The shrinkage produced is excellent, and close adherence of the mucosa to the underlying bone is secured The procedure rarely has to be repeated, and when it does is still comparatively harmless The minimum of inconvenience is caused to the patient Finally, the results secured have been very satisfactory Strict attention to detail being of the utmost importance, the technique is given in full The following will be required

5 per cent cocaine solution (with 2 to 3 minims of 1 in 1,000 adrenaline to the drachm), 20 per cent cocaine solution, 75 per cent alcohol, 30 per cent carbolic in paraffin, bicarbonate of soda solution (10 grains to the ounce), nasal speculum, syringe recording minims, with angle mount and special fine three inch needle, two wooden applicators gallipot, enamelled iron bowl, cotton wool, tumbler, kidney basin for used instruments, mackintosh apron for patient's use

TECHNIQUE

1 Spray the nasal cavity with 5 per cent cocaine and adrenaline solution

2 While this is producing anaesthesia and a certain amount of shrinkage, (*a*) load the syringe with carbolic in paraffin solution, (*b*) fill the gallipot with 75 per cent alcohol, (*c*) fill the tumbler with sodium bicarbonate solution, (*d*) prepare double ended nasal brushes with the wooden applicators and cotton wool

3 Paint the nasal cavity freely with 75 per cent alcohol

4 Touch the spot near the anterior end of the inferior turbinate selected for injection with 20 per cent cocaine

5 Give the enamelled iron bowl to the patient to hold, cautioning him to swallow nothing but at once to spit out into the bowl anything which may run back into the throat

6 Introduce the needle with loaded syringe attached at the selected spot, then run it along under direct visual control

pared proteose in ten cases of epilepsy and did not obtain any positive skin reactions Van Leeuwen (1932) tested the proteoses prepared from twenty four cases and found that they sometimes produced positive reactions in asthmatics but not necessarily in the asthmatics from whom the proteose was prepared He concluded that the reaction was therefore non specific Aldred Brown and Munro (1932) did not obtain any positive reaction with proteose prepared from fifty cases of acute rheumatoid arthritis Cormia (1933), investigating allergic skin patients found a positive skin reaction in both allergic and non allergic patients, which he suggests is due to local skin irritation Cornbleet and Kaplan (1934), in a chemical and biological study obtained an erythematous skin reaction with proteose but no reaction occurred when the proteose was first dialysed They suggest that the skin reaction is produced by salts and other irritants

Therapeutic Application of Proteose

Urinary proteose has been used in the treatment of a variety of allergic skin conditions (eczema urticaria, etc), asthma, hay fever, epilepsy and rheumatoid arthritis

ALLERGIC SKIN DISEASES

Oriel and Barber (1930) obtained a cure in sixteen out of nineteen cases of urticaria and in nine out of thirteen cases of simple prurigo Benefit was noted in five out of fourteen cases of Besnier's prurigo These authors also stated that proteose gives good results in dermatitis herpetiformis, but confess to disappointing results in psoriasis Burgess (1933) reported that five out of eight cases of chronic eczema cleared up completely, three out of eight cases of chronic urticaria were cured, and a further three cases were much improved Temporary improvement was obtained in four cases of Besnier's prurigo and of five cases of psoriasis one cleared up completely One case of dermatitis herpetiformis cleared up but subsequently relapsed Burgess regards these results as satisfactory for eczema and urticaria

Eichenlaub (1933) recorded marked improvement in four cases of eczema out of eleven One of two cases of psoriasis was cured He did not obtain any satisfactory results in neurodermia, dermatitis hepetiformis or chronic urticaria Eichenlaub (1934) subsequently stated that all the patients in whom he had reported favourable results had since relapsed and failed to respond to further treatment Cormia (1933) had unsatisfactory results in eight cases of allergic skin conditions Templeton (1933) also records poor results in fifteen cases of various allergic skin conditions Cornbleet and Kaplan (1934) observed no therapeutic benefit after treating fourteen cases of eczema with proteose

ASTHMA

Oriel (1933) treated seventy cases of asthma with proteose In analysing his results he divided the cases into two groups (1) protein sensitive cases (forty-four patients) and (2) non protein sensitive cases (twenty-six patients) A summary of Oriel's results is shown in Table I

TABLE I—*Showing Oriel's Results in Seventy Cases of Asthma Treated with Urinary Proteose*

Type	No	Free	Much Improved	Improved	Unchanged
Protein sensitive asthmatics	44	10 (23%)	20 (46%)	10 (23%)	4 (8%)
Non protein sensitive asthmatics	26	2 (8%)	5 (19%)	5 (19%)	14 (54%)

His criteria of improvement are as follows (1) Free —symptoms practically absent for six months (2) Much improved—attacks 75 per cent less (3) Improved—attacks 50 per cent less (4) Unimproved Oriel states that 70 per cent of protein sensitive asthmatics have a chance of marked amelioration compared with 27 per cent of the non protein sensitive asthmatics It should be noted that of the seventy cases twelve (that is, 17 per cent) became free for six months Darley and White head (1931) reported improvement in six out of nine cases of asthma Trasoff and Meranze (1932–3) state that they had unsatisfactory results in eight cases of asthma

HAY FEVER

Darley and Whitehead (1932) found that six out of twelve cases of hay fever obtained complete relief Watson (1933) reported improvement in seven cases of hay fever

RHEUMATOID ARTHRITIS

Barber and Oriel in one of their original communications stated that when proteose was given to patients with psoriasis associated with rheumatoid arthritis, although the psoriasis did not improve, the joint condition was ameliorated Aldred Brown and Munro (1932) treated fifty cases of rheumatoid arthritis with proteose, and recorded apparent success in one case only Yeoman, Sinclair Miller, Rutherford and Wesley Smith (1932) in a letter to the *Lancet* following Aldred Brown's paper, stated that they had obtained satisfactory results using proteose in the treatment of rheumatoid arthritis

EPILEPSY

Haviland Minchin (1932) treated seven cases of epilepsy with autogenous proteose Four cases showed no change one was slightly better for three weeks and then relapsed one case formerly having four to five fits a month became free for two months and subsequently relapsed, one case having major fits began having minor fits

Results in Present Series

In our investigation it was decided primarily to assess the therapeutic effects of proteose It was realized that even if proteose was not specific in its action as claimed by Oriel some therapeutic benefit might be obtained as often happens with non specific injections Proteose was administered to a series of fifty eight patients, composed of forty eight cases of asthma and ten cases of various allergic skin conditions Autogenous proteose was prepared from the urine in every case

Oriel and Barber suggested minute doses In their original paper they stated that injections of 0·025 c.cm will often cause a severe reaction Subsequently Oriel suggested an initial dose of *0·1 c.cm of a dilution ten* times weaker than the lowest dilution of autogenous urinary proteose which gives a *specific skin test the injection* to increase by 0·1 c.cm at a time until there is a reaction (increase of symptoms or malaise) or until the condition shows definite signs of improvement We were never able to confirm the presence of a specific skin reaction the only skin reaction produced being a small erythematous zone such as might be produced by the intracutaneous injection of any toxic substance We thus had to formulate our own method of dosage The routine doses given in our series were as follows

Weekly intramuscular injections of 1/2 c.cm followed by 1 c.cm of 1 in 1,000,000 1 in 100,000 1 in 10,000 and 1 in 1,000 dilutions These were followed by two further injections of 1·5 c.cm and 2 c.cm. of the 1 in 1,000 dilution The patients thus received ten weekly injections In only

Reviews

AN INTERPRETATION OF PRACTICAL MEDICINE

Funktionelle Pathologie eine Klinische Sammlung von Ergebnissen und Anschauungen einer Arbeitsrichtung By Dr Gustav von Bergmann (Pp 547 RM 25, geb, RM 26 60) Berlin J Springer 1936

The nations of Europe, recovering from the effects of the great war, find new problems awaiting solution This revival of interest in the health of the people is not only a stimulus to those in central authority entrusted with making provision for improved hygiene, but also a call or opportunity for the medical profession to revise, even to recast, its attitude towards medical problems Professor von Bergmann of Berlin would see in the changing circumstances an incitement to a change of mind in the physician himself He demands that when dealing with a patient the doctor must consider not only the disease but the patient, his antecedents, his environment, and his psychology Quoting with approval the Chinese philosopher's aphorism "that the sum of the parts is not the whole," he thinks that the right emphasis should be not as at present most upon the causal factors and the localization or degree of morphological disturbance—the anatomical findings are merely the concluding document in the pathological description of the course of the disease —but primarily upon the often insidiously beginning disturbance of function Out of this disturbed function come later the formal reactions of structure From this point of view he has produced a book which can by no stretch of imagination be regarded as a textbook of medicine or pathology, but which will be read with interest and is a valuable contribution to the philosophy of medicine The results of twenty-five years' work and teaching are put together to offer an interpretation of practical medicine as a study of functional pathology

With the introduction of radiology Professor von Bergmann's observations on the movements of the colon in man awoke in him a sense of many symptoms arising from a disturbance of healthy co-ordinated regulation, dyskinesia, a neuromotor disharmony Disturbances of function of the peptic part of the alimentary tract were easily investigated by means of a stomach pump Variations in secretion and motility following stimuli, the inhibitions that may follow shock, the discovery of the frequency of peptic ulcer and gastritis, led to the author's discarding the conception of gastric neuroses, and later of neuroses of any isolated organ There may even be a spasmodic or neurogenic peptic ulcer arising from disturbed function which would afford certain analogies to the doctrine of dyskinesia Perhaps most support for the doctrine followed observations on the extra-hepatic bile ducts and gall-bladder, and in dyskinesia there is at least one initiating factor in delay, inflammation and stone formation in the gall-bladder But associated with these changes there are alterations of the liver parenchyma itself, and von Bergmann would relate to small injuries with protein destruction a type of auto-intoxication, different forms of hepatic disease up to acute yellow atrophy in acute states, and cirrhosis in chronic states

This view of inflammation as a problem not only of pathological anatomy and not only of bacterial infection and immunity but as a central part of human clinical pathology is extended to diseases of other organs The earliest stage of this inflammation, whether in hollow viscera with glandular mucous membrane or in the large glands themselves, is an altered function, and there is an uninterrupted sequence from this disturbance of function to the gross anatomical findings To the susceptibility of tissues vitamin-lack contributes, and through the blood stream the secretions of the endocrine glands are transmitted How widespread the effects may be is shown in the pluriglandular disturbance, anorexia nervosa, in which all the tissues and organs waste, and the life processes are at a low ebb as in a psychic hunger-strike The disharmony of the endocrine glands has a striking example in hyperthyroidism, in which hereditary influences play an important part The problems of circulation depend, too, on the neuro-muscular mechanisms in the peripheral, the coronary, and the cerebral vessels The neuro regulation of the circulation, governed from nerve centres which react to peripheral stimuli, has led far away from any satisfying conception of visceral neuroses as such

The modern physician can no longer divide diseased conditions into functional and organic He must be aware of the psycho-physical disequilibrium in his patient His mission must be to take equal account of the need for his help called for by the subjective and objective aspects of the patient as a whole Without belittling the great advances obtained by the synthesis of scientific researches in medicine, and the application of laboratory methods, emphasizing indeed the value of these in academic teaching and in the pursuit of further knowledge, von Bergmann points out that in his care of his patient the skilled physician must often enough base his treatment on accumulated experience rather than upon exact knowledge The shrewd doctor will strive to detect the early disturbances of function and correct them before they bring about changes of morbid anatomy

TACHYCARDIA

Les Nevroses Tachycardiques By L Gallavardin and A Tourniaire (Pp 122, 24 figures 17 fr) Paris Masson et Cie

Les Tachycardies et leur Traitement By Dr Antonin Clerc (Pp 88, 6 figures 12 fr) Paris J B Baillière et Fils

In their monograph Drs Gallavardin and Tourniaire have presented the results of an extremely illuminating study of those cardiac syndromes which are related to disturbances of the sympathetic system A discussion of symptomatology includes many pulse charts illustrating the milder and more severe forms, the daily and periodic variations of heart rate, and the abnormal responses to exercise and change of posture The instability of body temperature, the variations in blood pressure, and the leucocyte count are further paths of investigation, electrocardiographic and orthodiagraphic studies show uniformly normal results in these patients The authors demonstrate that hyperthyroidism is not an aetiological factor, since the basal metabolic rate is neither constantly raised nor altered by iodine medication, and also since the subjects of nervous tachycardia do not give the hyperglycaemic response to glucose ingestion shown by thyrotoxic patients The pathogenesis is summarized as an intense excitation of the sympathetic supply of the heart with not only cardio-accelerator but also vaso constrictor and hypertensive consequences, accompanied often by an alteration in the rhythm of the heat regulating centres Drs Gallavardin and Tourniaire believe that the clinical study of nervous tachycardia is yet in its earliest stage, and that it holds in store "d heureuses surprises à ceux qui voudront bien s y consacrer"

Dr A Clerc takes a broader field in his survey He considers not only the essentially nervous forms but also

2 The therapeutic benefit obtained with injections of autogenous urinary proteose in cases of asthma is about the same as that obtained with peptone Any specificity which may be claimed for the former method does not outweigh the many advantages of a simpler and more general form of desensitization such as can be obtained with peptone

3 The therapeutic results obtained in cases of urticaria are encouraging and of sufficient interest in our opinion to warrant further investigation

In conclusion we wish to record our sincere thanks to Dr W Howel Evans for preparing the proteose in each case and to Dr R Kemp for his help in supervising the peptone injections

THE VALUE OF OLEOTHORAX IN OBLITERATIVE PLEURISY

BY

F G CHANDLER, M D, F R C P

Physician in Charge of Out patients St Bartholomew's Hospital and Physician to the City of London Hospital for Diseases of the Chest

The ingenious idea of Bernou of employing large quantities of oil in the pleural cavity was unfortunately overdone and exploited in certain quarters with an uncritical enthusiasm, with the result that opinion veered the other way until the method appears to have become almost entirely discounted This is to be regretted, for though a minor procedure, it occupies a position of great importance, used strictly within its proper indications and limitations If obliterative pleurisy is taking place with dangerous prematurity in the course of artificial pneumothorax oil in the pleural cavity is the only thing that will keep the pleural layers apart and so save the patient from a thoracoplasty As the obliteration of the pleura proceeds so will the oil be driven to the upper zone of the chest, where collapse is most commonly wanted It will be held there under considerable pressure and contrary to what Mr Morriston Davies wrote in an excellent contribution to the *American Journal of Thoracic Surgery* in December 1935, I believe that it is the high pressure oleothorax that is of the greatest value

The division of adhesions in cases of incomplete pneumothorax may itself start the process of obliterative pleurisy Then although the intervention may have given complete rest to the lung closed all cavities abolished all symptoms and led to the complete disappearance of tubercle bacilli, the inexorable and irresistible march of the pleural symphysis may, as it reaches the higher zones of the thorax reopen the cavities tear apart quiescent and healing areas, and so start the disease process all over again

If it is evident that the pleural obliteration is progressive or if it is possible that the premature re expansion of the lung will reactivate the disease something must be done to prevent it There are only two possible courses one is thoracoplasty, and the other is to establish an oleothorax Of the two oleothorax is obviously to be preferred

Oil is incompressible and practically unabsorbable, or absorbed only over a very long period It is driven to the upper part of the thorax where it is most usually wanted, and there it will remain unchanged and unnoticed by the patient for many years

The objection raised is that it may rupture into the lung I believe that this is putting the point the wrong way round The lung if the seat of active tuberculosis may rupture into the oil just as a spontaneous pneumothorax may occur with or without an artificial pneumothorax with or without pleural fluid and with or without an oleothorax At the same time it cannot be denied that oil under considerable pressure over a softened area of diseased lung could burst through If this happens it is an unpleasant and sometimes a grave event With a thickened pleura however which usually exists under the conditions for which I advocate oleothorax, I believe this accident to be rare moreover it is a risk most patients would be prepared to take if they understood the alternative At the very first suspicion of oil in the expectoration the oil in the pleura must, of course, be immediately replaced by air

Conditions Necessary for the Establishment of a Successful Oleothorax

There are two essentials in my opinion a rigid mediastinum, and a pleural cavity of strictly limited capacity The first is obvious, the second perhaps not

In the early days I tried therapeutic oleothorax as a substitute for pneumothorax and I found that three pints of oil would not half fill the hemithorax To maintain an adequate lung collapse by oil with a non rigid mediastinum and a completely free pleura would take in an average case, probably six to eight pints and this would seem highly undesirable With a mobile mediastinum no amount of oil would be effective without producing simultaneously gross mediastinal displacement Hence it can be seen that commencing or, better partially developed obliterative pleurisy provides the ideal conditions for oleothorax The mediastinum is fixed the pleura is probably thickened and unyielding the capacity of the pleura is limited and progressively becoming smaller

Nevertheless I have cases where an oleothorax was performed as a substitute for pneumothorax One patient was a child aged 7 whose case I published in the *British Medical Journal* (June 18th 1932) There was acute phthisis and extensive cavity formation Artificial pneumothorax treatment was given and a huge central cavity would not close because of adhesions These were divided and the cavity closed The child so dreaded the refills of air that I decided to perform an oleothorax This was done in 1931, and the child to day is perfectly well living the normal life of a schoolgirl with the oil still present It has apparently become encysted from apex to base She has never had any recurrence of symptoms
